SAFETY GUIDE OF CARBIDE PRODUCTS

KORLOY Inc. is continuously trying to develop safer and higher quality products
Please be aware of the safety guidelines below prior to using KORLOY Inc. products

- It is generally accepted that the proper handling of cemented carbide tools requires awareness of safety as noted above. For more information, please contact us.
- KORLOY does not accept any responsibility for any accident caused by inappropriate use, abuse of tools, or changes to the products.

1. PL (Product Liability)

In accordance with the PL (Product Liability) law, we have attached a WARNING label on the case of KORLOY products. There is no warning on the surface of the tools. Please read this safety guidelines before using carbide tools and provide safety education to all users.

2. Basic characteristics of CEMENTED CARBIDE tools

Cemented carbide tools are made of carbides, nitrides, carbonitrides, oxides of Tungsten(W), Titanium(Ti), Alluninyum(Al), Silicon(Si), Tantalum(Ta), Boron(B) etc and metal omponent like Cobalt(Co), Nickel(Ni), Chrom(Cr), Molybdenum(Mo) as binder. Cemented carbides tools have high hardness and specific gravity.
Generally there's no smell but according to usage and treatment, appreance and color could be changed

3. Precaution for CEMENTED CARBIDE tools

1) Cemented carbides are extremely hard and brittle at the same time.
   Impact shock or excessive clamping power could cause fracture or breaking of the tool.
2) Cemented carbides have large sepcific gravity, thus they require special attention as a heavy material when you handle big sizes or large quantities.
3) Cemented carbides have different thermal expansion coefficient with steel and ferrous materials. Shrink fit or swell fit products may cause trouble if they are used at undesirable conditions like extremly high or low temperatures.
4) There are several cemented carbide products having sharp cutting edges.
   Be careful not to handle the tools with bare hands which may cause cuts or injury, especially when removing the tools from the case, do not touch the cutting edge and be careful not to drop it.
5) Storing carbide tools in a corrosive atmosphere may cause erosion which can reduce toughness.
6) Please refer to the catalouge safety guidance prior to handling the tools.
7) Do not absue tools under inappropriate conditions.

4. Precaution for machining (grinding, welding, EDM) of CEMENTED CARBIDE tools

1) Surface condition can affect the toughness of the tool, so it is recommended to use a diamond grinding wheel.
2) Grinding of cemented carbide creates mist and dust. It contains harmful compositions like Cobalt(Co), thus it is recommended to use a mask, mist collection, and other protective facilities. If the dust gets in your skin or eye, rinse immeditely with continously running water.
3) In case of grinding with coolant, coolant contains harmful metal components which cause environmental problems. Handle the coolant according to the manufacturer's recommendations.
4) Check for cracks after re-grinding carbide tool and reuse.
5) Marking with laser or electric pen may cause cracks on the carbide tool. The crack can shortened tool life.
6) EDM of carbide may cause residual cracks on the carbide tool, so if necessary , remove the crack with a grinding process.
7) Brazing of carbide tools at extremly high or low temperatures compare with the melting point of brazing materials may cause loosening or breakage.
8) Overheating a oil base coolant may cause a fire or flames, thus be prepared for fire prevention.

5. METALCUTTING SAFETY

	DANGEROUS FACTOR	SAFETY COUNTERPLAN
Cutting tools	· Sharp cutting edge of cutting tools may cut your bare-hand	· Use gloves when pulling out the insert from the case or mounting it on the machine
	· Inappropriate conditions or usage may cause fragmentation and expel parts of tools which may cause injury	· Use glasses or safety cover for your safety · Use the tools within the recommended range · Please refer to catalogue and safety guidelines first.
	· Severe load on tool and premature wear of cutting edge may bring excessive cutting force on tool, causing fracture of the tool and may cause injury	· Use glasses or safety cover for your safety · Change the tool as required before excessive wear or fracture
	· Chips evacuated during cutting are hot and sharp and may cause burns and cuts	· Use glasses or safety cover for your safety · Stop machining and put safety glove on and use a hook tool to remove chips
	· Touching the workpiece immediately after cutting may cause burns	· Use gloves or safety cover for your safety
	· Be aware of sparks, fire, or explosion of hot chips generated during the cutting operation	· Do not use at the place where having explosive materials · Prepare for fire extinguishments
	· In case of high RPM machining, vibration and chattering may occur due to the improper balance of the machine	· Use glasses or safety cover for your safety · Check first if there's any chattering, vibration or strange noises prior to your main cutting operation
	· Touching a burr remaining on the workpiece with a bare-hand may cause a cut	· Do not touch the burr with bare-hand · Use gloves or safety cover for your safety
	· Loose clamping of the workpiece may cause the tool to fracture and result in damage to the cutter body and possible injury	· Clamp the workpiece tightly
	· Tools are operated to right-hand direction normally. Left-hand direction operation can cause fracture of tool and body damage	· Do not use left-hand direction without notice · Check the package of product to check the availability of left-hand operation
Indexable tools	· Loose clamping of inserts and parts may result in ejection of the tool during cutting and may cause serious injury	· Check the clamping of inserts and parts prior to machining, and use original parts only
	· Over loaded clamping of inserts by a lever (such as a pipe) may cause dangerous fracturing of parts and inserts	· Do not use lever inappropriately
	· In case of high speed machining, parts and inserts can be forced out by centrifugal force	· Use within recommended condition · Use glasses or safety cover for your safety
Rotating tools	· Since cutter has sharp cutting edges touching with a bare-hand may cause a cut	· Use gloves or safety cover for your safety
	· It is dangerous to use glove with rotating machine · Contact with body or clothes is dangerous with rotating parts	· Do not wear gloves when you work with rotating machine · Keep your body and clothes away from rotating machine
	· Vibration generated by balancing trouble may cause a fracture and ejection of the tool which may cause serious injury	· RPM should be controled within recommended condition · Check the balance of rotating part periodically
	· In case of drilling, the uncut bottom core can fly out of the part with high speed and cause serious injury	· Use gloves or safety cover for your safety
	· The edges of small diameter drill are sharp and easy to break	· Use gloves or safety cover for your safety
Brazed tools	· Fragmentation and ejection of brazed carbide tip may cause injury	· Check the brazed tip before using. · Do not use at high temperature cutting condition
ETC	· There's a possibility of breaking the carbide tip after several brazing	· Do not use brazing a tip that has been brazed several times
	· Abusing may cause fragmentation of tool and is very dangerous.	· Stick to safety regulations and guidelines

Technical Information for Aluminum

AK special chip breaker for aluminum

▶ Unique and 3-dimensional rake angle controls chip breaking and chip flow ensuring longer tool life and reducing cutting load
▶ High rake angle at cutting edge part reduces cutting load to increase tool life.
▶ Buffed finish on top face controls chip flow reducing built-up edge

❶ High rake angle & tabby pattern chip pocket - Low cutting load
❷ Unique rake angle design - Effective chip breaking and good chip flow
❸ Unique and 3-dimensional top face - Longer tool life & Excellent surface roughness
❹ Tabby pattern & Sharp cutting edge - Distributing cutting load, long tool life
❺ Buffed on top face - Excellent machining, Reducing built-up edge, Excellent chip flow

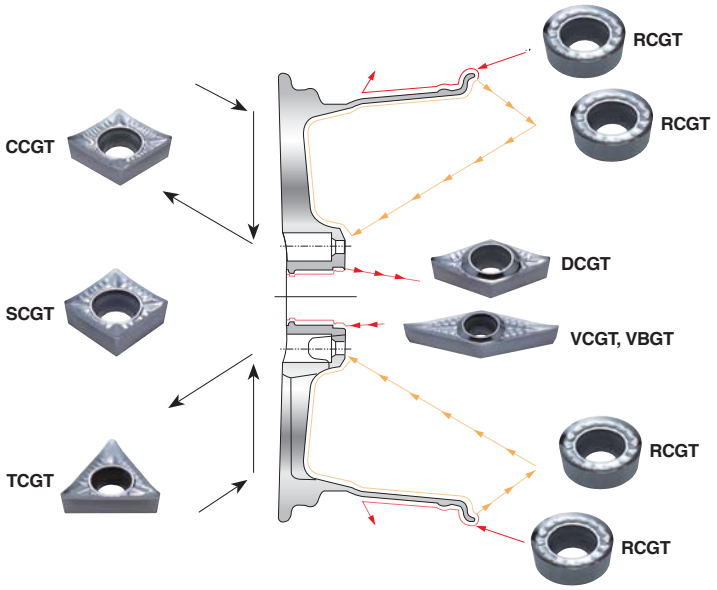
AR special chip breaker for aluminum

▶ AR chip breaker ensures reliability and good cutting performance at high feed, speed and interrupted machining

❶ Flat corner cutting edge improved productivity at high feed machining and ensures good surface roughness and reliability owing to strong cutting edge
❷ Specially buffed on top face controls chip flow reducing built-up edge
❸ KORLOY's own technology applied for cutting edge and corner shape controlling chip flow ensures longer tool life
❹ KORLOY special chip breaker design controls chip flow at high speed machining

AK and AR chip breaker specially developed for aluminum

	Recommendation range	Grades
AK	ap=0.1~5.0mm fn=0.03~0.5mm/rev	H01(Uncoated cemented carbides K10~K20) ND1000(Diamond coating)
AR	ap=0.5~6.0mm fn =0.05~0.6mm/rev	H01(Uncoated cemented carbides K10~K20) ND1000(Diamond coating) PD1000(DLC coating)



Features of H01 and cutting conditions

• Useful for aluminum and alloyed steel machining • Buffed on top face reduced built-up edge
• 3-dimensional design reduced cutting load and shows good performance at high feed and speed machining

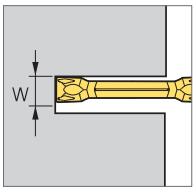
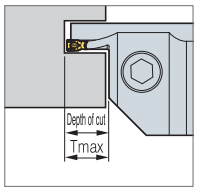
Selection System of Holder

▶ Follow these 3 simple directions to choose the right insert and holder for your application



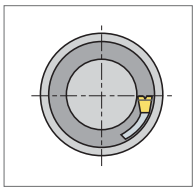
Insert and holder

Choose an insert and holder that best applies to your application according to the cutting width and part of workpiece to be machined.



Holder Tmax

Choose the holder with the shortest overhang that will still meet the cutting depth required



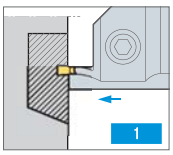
Machining Dia.

Choose the largest size of shank depending on the initial grooving diameter required in the application

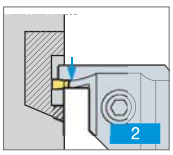
Notice : To minimize chattering, use the shortest holder according to Tmax.

Optimization of Face Grooving

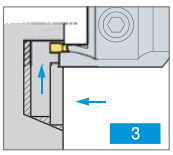
Roughing : When face grooving deareases the cutting speed 40% below a normal face turning operation



• Grooving at the initial diameter

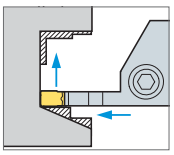


• Face turning away from center

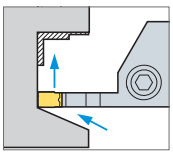


• Face turning to center

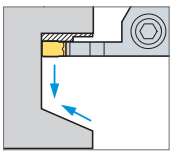
Finishing : When face grooving deareases the cutting speed 40% below a normal face turning operation



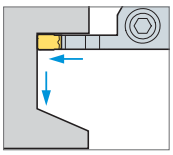
• Grooving at the initial diameter to the final cutting depth and face turning away from center



• Radius operation toward final dimension at the bottom



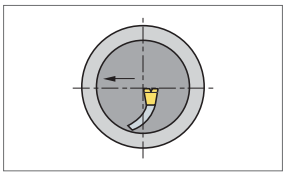
• Face turning to center



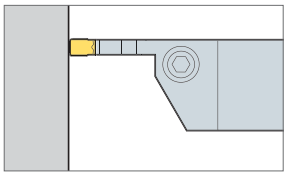
• Grooving for the right dimension you want

Notice for Face Grooving

▶ Before machining, check and adjust the following holder position



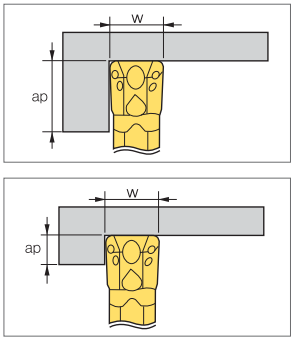
- Check the cutting edge height at the center of the workpiece
- Machine towards the center and check for burrs



- For better surface roughness, set up the insert in order to perpendicular at center line

Turning and Grooving

Selection of Insert



▶ Feed rate
- Decide maximum feed rate after considering the insert's characteristics and machine capabilities. (Fmax = W x 0.075)
- Max feed rate should not be larger than the corner radius of the insert
- In grooving applications, chip evacuation problems can be remedied by using step feed methods at small intervals

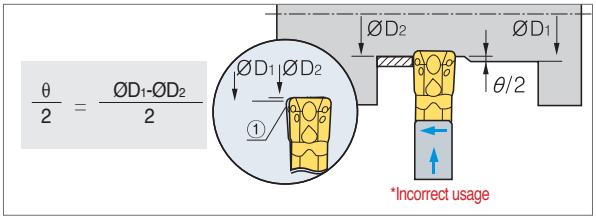
▶ Depth of cut
- The minimum depth of cut should be bigger than corner radius of insert
- When deciding on the max depth of cut please consider the machine's cutting load
- Depending on the shape of the insert, deflection of work piece and clearance angle can be changed

Notice for turning

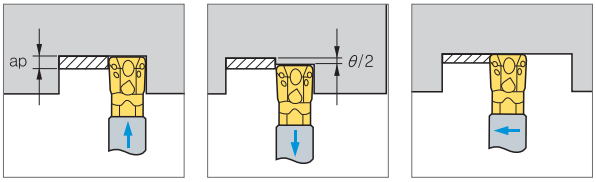
▶ KGT/MGT tools are designed to incur side cutting force from its clearance angle; this feature gives you advantage over a standard ISO insert.
▶ The standard MGT insert also provides a "wiper" effect to improve surface roughness

Notice for Finishing (offset need final quality)

▶ After desired diameter is grooved, continuous turning operation might cause some deflection of the workpiece. In these cases follow the given formula, offsetting these factors enables the desired diameter that you want

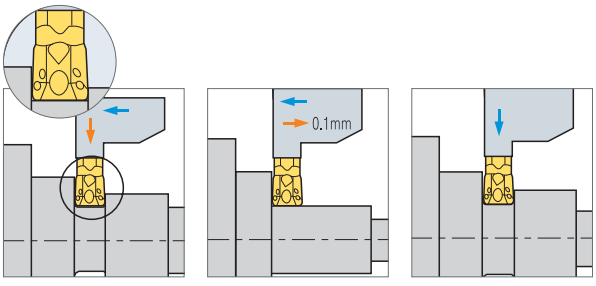


▶ To eliminate the difference in the machined diameter by utilizing the clearance angle (which is commonly generated during the final turning operation) follow the directions above when machining
To obtain a good surface roughness without offsetting in an application follows the directions below
1) Groove to the desired diameter
2) Pull the tool backs a total distance of θ/2
3) Continue the external turning operation to desired diameter

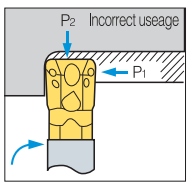


Notice for MGT turning applications

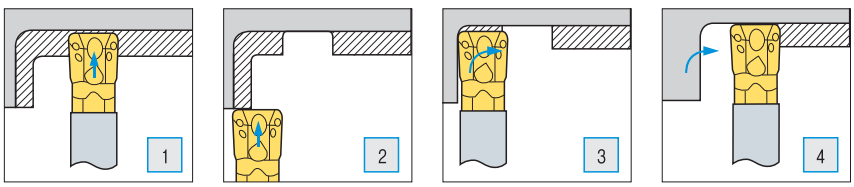
▶ KGT/MGT tools are available for grooving and turning as a multifunctional tool. When using a M.G.T tool keep in mind that the tool imitates a standard ISO turning application. The application uses a positive clearance angle where a tool's cutting force and depth of cut are all applied in an application. This might create normal wear on the insert, after turning, a grooving process might not meet the desired diameter on the work piece. To off set this, adjust the tool 0.004 inches and return to the original position of the grooving application



Machining workpiece with a radius bigger than the insert's corner radius



Stabilize your tool pressure. KGT/MGT tools create a cutting load when machining a workpiece with a radius larger than the corner radius of insert (shown in the picture). The unequal cutting force might initially break the insert or holder



Parting off & Grooving

Insert

Lead angle applications	Lead angle 0°(Neutral)	Lead angle 4° ~ 8°	Lead angle 8°~15°
			• 4°- Pipe (Tubing and hollow bar) • 6°- Pipe and solid bar • 8°- Solid bar • 15°- Small diameter Solid bar	• Parting off on solid bar type • Occurring the center stub when parting off • Prevent to be deflected workpiece by cutting diretion during parting off • Availble for use deep parting depth	• Reduce the center stub when parting off on solid bar type • Reduce the burr when parting off on tubing or hollow bar type	• Parting off on small diameter and hollow bar type • Reduce the burr and center stub when parting off on small diameter solid bar type

※ Available Inserts : MGMR/L - □□ - PS/PT, KGMR/L - □□ - LP/RP
(Lead angle) (Lead angle)

Selection of Insert

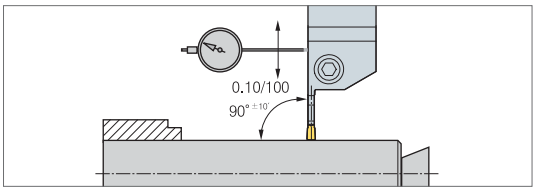
▶ To properly match the insert and cutting condition, the following factors should be considered
- Width of insert • Chip breaker • Grade and nose R

▶ The relationship between the cutting width and cutting depth
- Neutral type, inserts with a 0 degree lead angle are best when used an applications maximum depth of cut
- In general alloy steel, the maximum depth of cut = W x 0.8

▶ Insert with lead angle
- To reduce burrs, we recommend using insert with a lead angle.
  Insert that have larger lead angles reduce burrs but will also deareases tool life.
  In the case where burrs are acceptable, we recommend using a neutral type insert

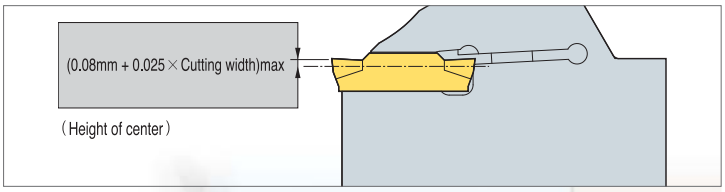
Setting of Holders

▶ The cutting position should be exactly mounted on machined axis in order to create a perpendicular direction or 90 to minimize vibration



Setting of Parting off

▶ The edge height of an insert should be set within ±0.1mm based on the center line
- Parting off should be done as close to the chuck as possible to minimize vibration



Notice

▶ Keep a consistent cutting speed and feed
- Use proper amounts of coolant for better performance
- Properly clean the insert pocket before mounting insert

Usage

▶ If insert is worn, immediately replace with a new insert.
This is to prevent the damage on the workpiece
- If the holder seat is worn or damaged replace with a new one immediately for stable clamping
- Do not grind or regrind the holder seat

Selection of Chip Breaker

Our chip breakers are designed to narrow chips during grooving operations.
Narrow chips usually offer the following advantages
▶ Deareases friction between chips and the workpiece.
This usually gives a better surface roughness finish
▶ With better chip flow, a machinist is able to increase feed rates due to a reduced cutting load

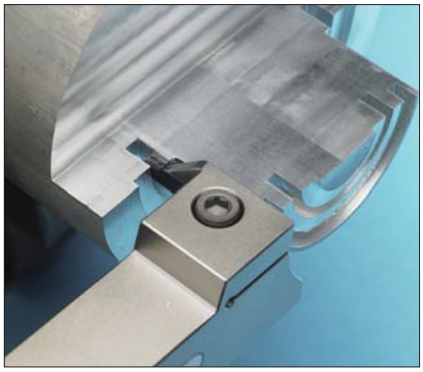
Inserts are offered with two edges, for better economical machining

MGT Series



- Inserts are offered with two edges, for better economical machining
- Multi function operations - Reduce cycle time & increase productivity with the ability to groove, turn, face or copy in an application.
- Shorten time & save on tool cost - Korloy's MGT system allows a machinist to apply one tool against many applications, reducing the number of tools
- Flat Cutting Edge - MGT tools have a flat geometry on its cutting edge to ensure excellent surface finishes. Even in high Feed applications by using a wiper function, Korloy ensures excellent surface finishes in roughing operations.

Geometry of chip breaker

MGM(G)N-M

- Specially designed chip breaker allows a smoother chip flow versus conventional flat-top geometries through the use of a central chip breaker
- Specially placed convex dots assists with chip control in external machining, for a smoother chip flow.
- Chip breaker designed for turning & grooving applications

MGMN-G

- Specially designed chip breaker allows narrower chips to promote better chip flow
- Specifically designed for grooving applications

MRMN-M

- Full radius geometry for applications that require profiling
- Available for relief machining

MFMN300

- Specially designed chip breaker allows narrower chips to promote better chip flow
- Chip breaker specially designed for face-grooving

MRGN-A

- Specially designed high positive geometry, ideal for machining aluminum
- The chip breaker's super buffed, high rake angle allows optimal chip flow of aluminum

MGMR-PS

- Sharply designed cutting edge.
- Recommended in machining low carbon steel and stainless steel
- Specially designed chip breaker allows narrower chips to promote better chip flow.
- Able to machine Feed rates and small diameter cutting

MGMR-PT

- Stronger cutting edge with a negative land for tougher applications
- Able to machine at Feed rates as high and bar stock
- Chip breaker design helps narrows chips for better flow

MGMN-L

- Sharp cutting edge
- Low cutting resistance
- For auto CNC machine
- For small Dia. processing

MGMN-R

- Strong cutting edge

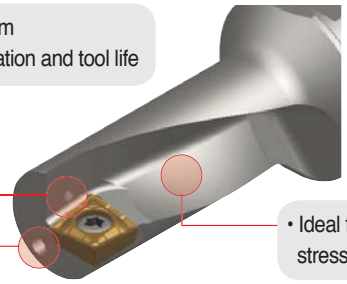
Tool design by FEM analysis

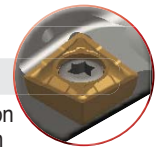
- Double coolant system
- Excellent chip evacuation and tool life

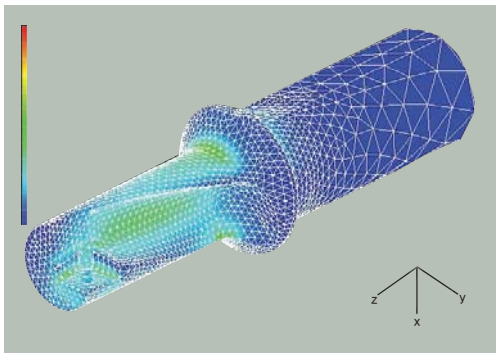


- Ideal flute design minimizing stress concentrations

※ Clamping tip

Correct : High cutting edge position
Wrong : Low cutting edge position





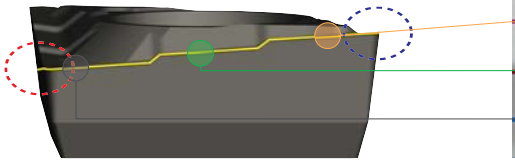
- Minimized stress during cutting, prevented damage from vibration and longer tool life

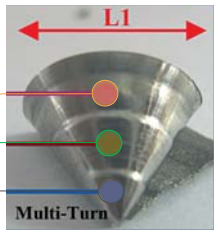
Optimized design

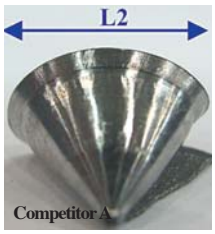
Creative stepping cutting edge

Drilling edge (Drilling)

Turning edge (Internal, external and face turning)







- Special chip formed by edge geometry Better chip
- evacuation due to small radius width of chip curl

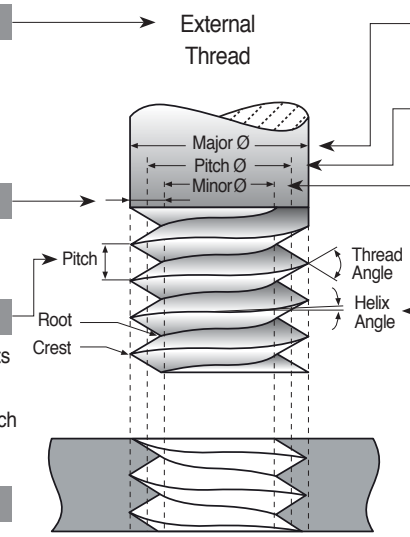
Special Features

External Thread
A thread on the external surface of a cylinder screw or cone

Depth of Thread
The distance between the crest and root measured from normal to the axis

Pitch
The distance between the corresponding points on adjacent thread forms measured parallel to the axis. This distance can be defined in millimeters or by the tpi (threads per inch), which is the reciprocal of the pitch

Nominal Diameter
The diameter of which the diameter limits are derived by the application of deviation allowances and tolerances



Internal Thread
A thread on the internal surface of a cylinder or cone

Major Diameter
The largest diameter of a screw thread

Pitch Diameter
On a straight thread, the diameter of an imaginary cylinder, the surface of which cuts the thread forms where the width of the thread and groove are equal

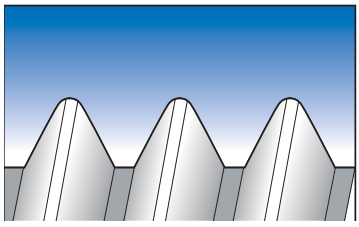
Minor Diameter
The smallest diameter of a screw thread

Helix Angle
For a straight thread, where the lead of the thread and the pitch diameter circle circumference form a right angled triangle, the helix angle is the angle opposite of the lead

Straight Thread
A thread formed on a cylinder

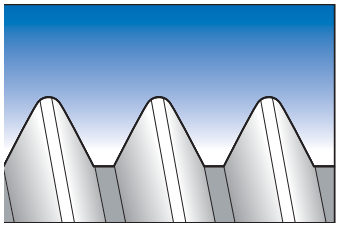
Taper Thread
A thread formed on a cone

Left handed thread



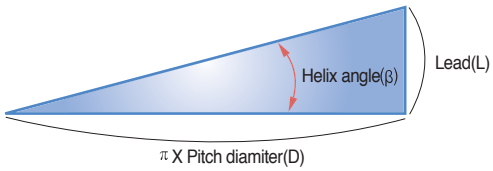
A thread which, when viewed axially, winds in a counter clockwise and receding direction. All left handed threads are designated LH

Right handed thread



A thread which, when viewed axially, winds in a clockwise and receding direction
Threads are always right handed unless they are specified

The Helix Angle (β)

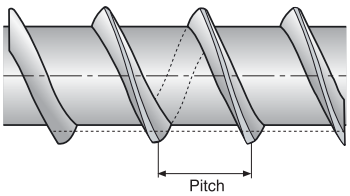


For a straight thread, where the lead of the thread and the pitch diameter circle circumference form a right angled triangle, the helix angle is the angle opposite of the lead

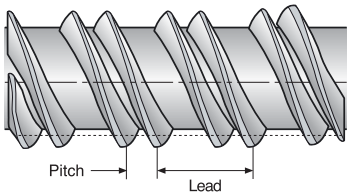
Machining a Multi-start Thread

▶ A thread in which the lead is an integral multiple, greater than one, of the pitch. A multi-start thread permits a more rapid advance without a coarser (larger) thread form

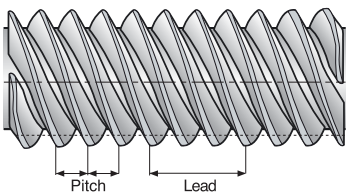
First Start Machined



Second Start Machined

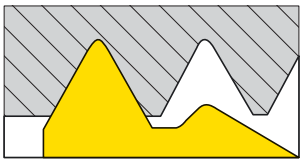


Third Start Machined (Final, 3 Starts Thread)



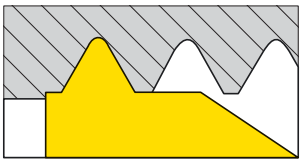
Insert Profile Style

Partial Profile



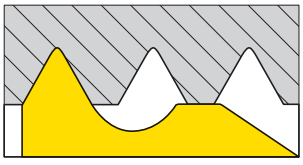
The V partial profile insert cuts without topping the outer diameter of the thread. The same insert can be used for a range of different thread pitches which have a common thread angle

Full Profile



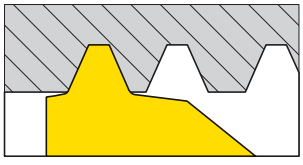
The full profile insert will form a complete thread profile including the crest. For every thread pitch and standard, a separate insert is required

Full Profile for Fine Pitches



The full profile for Fine Pitches will form a complete thread
The topping of the outer diameter is generated by second tooth

Semi Full



The Semi profile insert will form a complete thread including crest radius but without topping the outer diameter
Mainly used for trapezoidal profiles

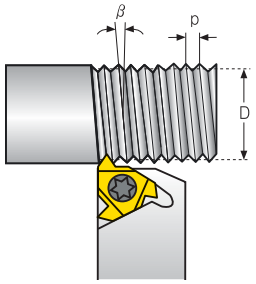
Calculating the Helix Angle(β)



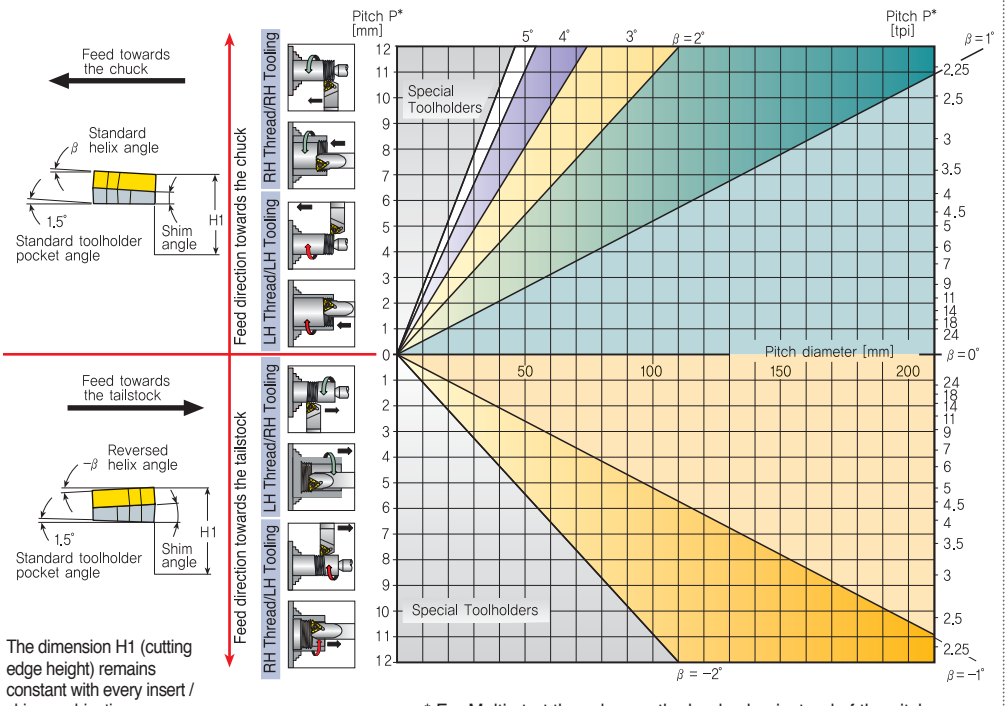
• The helix angle is calculated by the following formula :

$$\beta = \tan^{-1}\frac{P \times N}{\pi \times D}$$

β - Helix angle(°)
P - Pitch(mm)
N - No. of starts
D - Pitch diameter(mm)
Lead = P x N

• The helix angle can also be found from the diagram below

Helix Angle Diagram

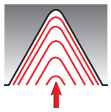


The dimension H1 (cutting edge height) remains constant with every insert / shim combination

* For Multi-start threads, use the lead value instead of the pitch

Thread Infeed Method

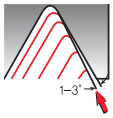
Radial Infeed



Radial infeed is the simplest and quickest method.The feed is perpendicular to the turning axis, and both flanks of the insert perform the cutting operation. Radial infeed is recommended in 3 cases

- when the pitch is smaller than 16 tpi
- for material with short chips
- for work with hardened material

Flank Infeed (modified)



Flank infeed is recommended in the following cases

- When the thread pitch is greater than 16 tpi. Using the radial method,the effective cutting edge length is too large, resulting in chatter. for TRAPEZ and ACME. The radial method result in three cutting edges, making chip flow very difficult

Alternate Flank Infeed

Use of the alternate flank method is recommended especially in large pitches and for materials with long chils

- This method divides the load equally on both flanks, resulting in equal wear along the cutting edges. Alternate flank infeed requires more complicated programming, and is not available on all lathes

In order to perform a thread milling operation, a milling machine with three-axis control capability of helical interpolation is required. Helical interpolation is a CNC function producing tool movement along a helical path. This helical motion combines circular movement in one plane with a simulataneous linear motion in a plane perpendicular to the first. For example, the path from point A to point B(Fig,A) on the envelope of the cylinder combines a circular movemint in the xy plane with a linear dispalcement in the z direction
On most CNC systems this function can be execyted in two different ways:

GO2 : Heilcal interpolation in
a colckwise direction
GO3 : Helical interpolation in
a counter-clockwise direction

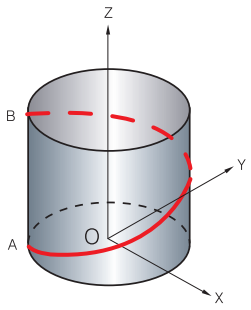

Fig. A

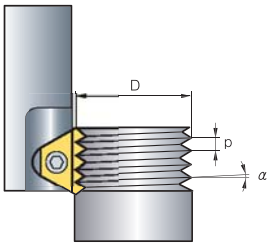

Fig. B

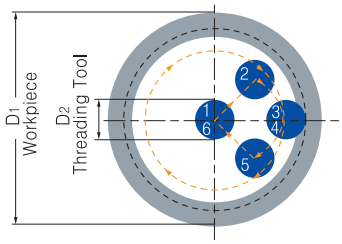
▶ The thread milling operation (Fig. B) consists of circular rotation of fhe tool around its own axis togerther with an orbiting motion along the bore or workpiece circumference. During one such orbit, the tool will shift vertically one pitch length. These movements combined with the insert geometry create the required thread form. There are three acceptable ways of approaching the workpiece with the tool to initiate production of the thread:

1. Tangential Arc Approach
2. Radial Approach
3. Tangential Line Approach

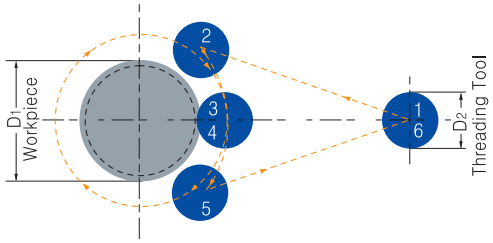
Tangential Arc Approach

▶ With this method, the tool enters and exits the workpiece smoothly. No marks are left on the workpiece and there is no vibration, even with harder materials. Although it requires slightly more complex programming than the radial approach (see below), this is the method recommended for machining the highest quality threads

Internal Thread



External Thread



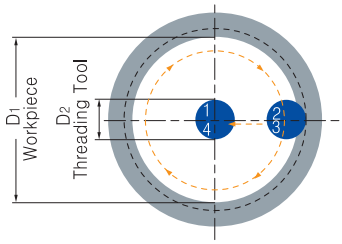
1-2 : rapid approach
2-3 : tool entry along tangential arc, with simultaneous feed along z-axis
3-4 : helical movement during one full orbit (360°)
4-5 : tool exit along tangential arc, with continuing feed along z-axis
5-6 : rapid return

Radial Approach

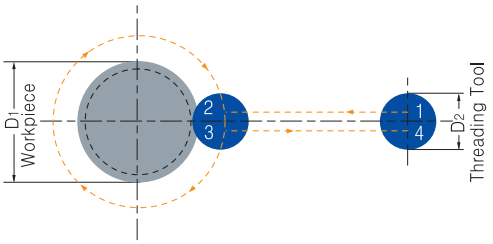
▶ This is the simplest method. There are two characteristics worth nothing about the radial approach:
A. a small vertical mark may be lift at the entry (and exit) point. This is of no significance to the thread itself
B. when using this method with very hard materials, there may be a tendency of the tool to vibrate as it approaches the full cutting depth

▶ Note: Radial feed during entry to the full profile depth should only be 1/3 of the subsequent circular feed!

Internal Thread



External Thread

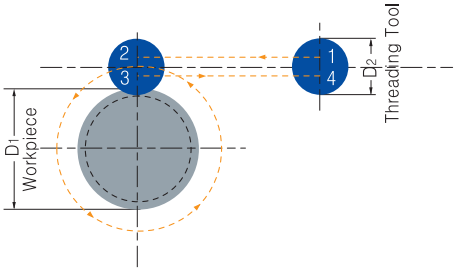


1-2 : radial entry
2-3 : helical movement during one full orbit (360°)
3-4 : radial exit

Tangential Line Approach

▶ This method is very simple, and has all of the advantages of the tangential arc method. However, it is applicable only with external threads

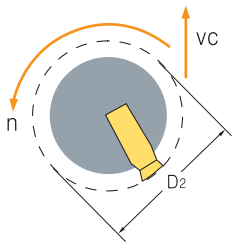
External Thread



1-2 : radial entry with simultaneous feed along z axis
2-3 : helical movement during one full orbit (360°)
3-4 : radial exit

Preparing for the Thread Milling Operation

Calculation of Rotational Velocity and Feed at the Cutting Edge



$$n = \frac{vc \times 1000}{\pi \times D2}$$

$$vc = \frac{n \times \pi \times D2}{1000}$$

$$F1 = n \times z \times fn$$

n - Rotational Velocity [R.P.M]
vc - Cutting Speed [m/min]
D2 - Tool holder Cutting Dia. [mm]
F1 - Real Feed rate at the Cutting edges [mm/min]
z - No. of Cutting Edges
fn - Feed per Rooth per Rotation [mm/rev]

Calculation of Feed Rates at the Tool Center Line

▶ On most CNC machines, the feed rate required for programming is that of the center-line of the tool. When dealing with linear tool movement, the feed rate at the cutting edge and the center line are identical, but with circular tool movement this is not the case The equations define the relationship between feed rates at the cutting edge and at the tool center line

Grades and Applications

Grade	Application
PC9570T	**First Choice for steel and cast iron** A tough sub-micron substrate with TiCN coating Provides good fracture toughness and excellent wear resistance
PC9070T	**General grade** Enhance wear Resisfomce with new-coating technology Multi layer film Superior performance for stainless steel and HSS

Trouble shooting

Problem		Possible	Solution
	**Increased insert flank wear**	Cutting speed too high Chip is too thin Insufficient coolant	Reduce cutting speed/use coated insert Increase feed rate Increase coolant flow rate
	**Chipping of cutting edge**	Chip is too thick Vibration	Redyce feed rate / Use the tangential arc method Increase RPM Check stability
	**Material Built-up on the cutting edge**	Incorrect cutting speed Unsuitable carbide grade	Change cutting speed Use a coated carbide grade
	**Chatter / Vibartion**	Feed rate is too high Profile is too deep Thread length is too long	Reduce the feed. Execute two passes, each with increased cutting depth/ Execute two passes, each cutting only half the thread length Execute two passes, each cutting only half the thread length
	**Insyfficient thread accuracy**	Tool deflection	Reduce feed rate / Execute a “zero” cut

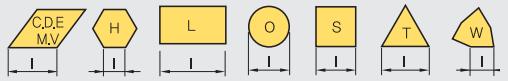
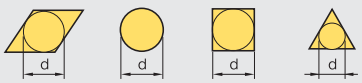
5 Cutting Edge Length, Diameter of Inscribed circle

S P K R 12 03 ED 08 S R - MX

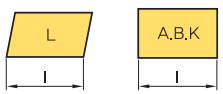
■ Metric system ※ Decimal integer constant



■ Inch system



· Use 1/32″ unit for a insert having smaller I.C under 1/4″
· Use 1/8″ unit for a insert having larger I.C over 1/4″



※ In case of rectangular and rhombic insert indicate cutting edge length instead of inscribed circle.

New serrated edge design increases productivity by reducing insert cutting load

Power Buster

- New tooling utilizing a specially designed serrated edge to increase productivity by reducing the cutting load.
- Double-sided 6 corner insert geometry ensures high rigidity, long tool life and cost efficiency
- The serrated edge divide the chips into smaller pieces. This feature provides excellent chip control, reduces interference of the cutter and ensures good durability of the cutter body.
- AA (approach angle) : 45° and 80° available (same insert used)
- Application : High depth of cut and feed rate(Steel, Cast iron)

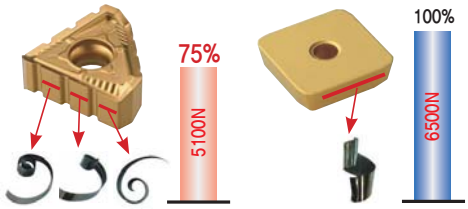
Features of Insert

❶ Major cutting edge(serrated edge)

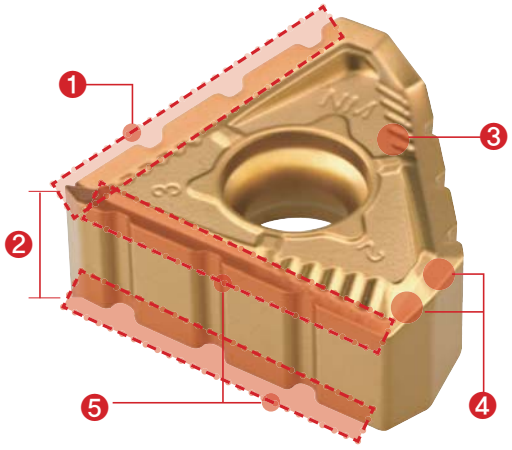
- Low cutting forces
- Ideal for chip control, divides chips into small pieces for proper chip evacuation. Double sided 6 corner insert
- Ideal edge design for Steel and Cast iron rough milling

Comparison of chip control and cutting force

Power Buster	ISO milling insert

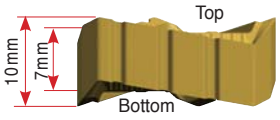


Workpiece : SCM440
Cutting condition : vc=200m/min
ap=8mm
ae=90mm
fz=0.3mm/t



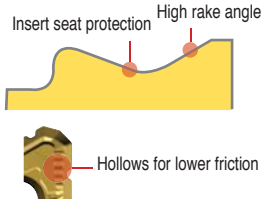
❷ Thicker insert

- Thick insert guarantees high rigidity
- Balanced insert design for stable mounting



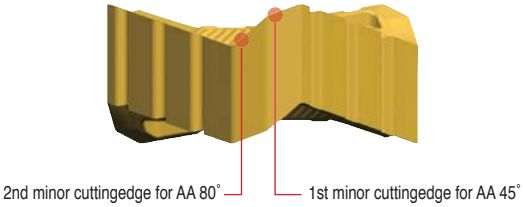
❸ NM Chip breaker

- High rake angle for low cutting force
- Good chip flow at various feed and depth of cut
- Inserts are protected with seats for a precise mounting
- Low friction and good heat evacuation at high depth cut



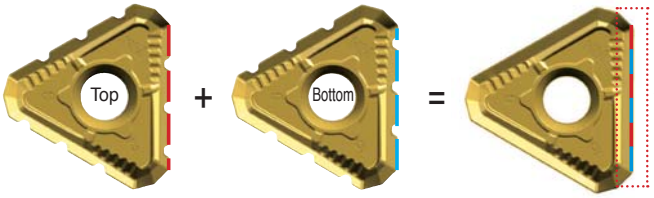
❹ Minor cutting edge

- High rake angle to avoid interference with chip
- Calculated minor cutting edge angel for both AA 45° & 80° cutter



❺ Mirror system

- Cutting edge on the both side of insert covers all overlapped cutting area



Perfected cutting edge by using 2 different side of cutting edge

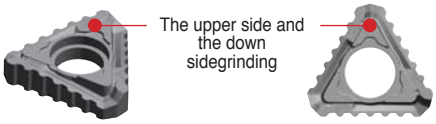
Features of Cutter

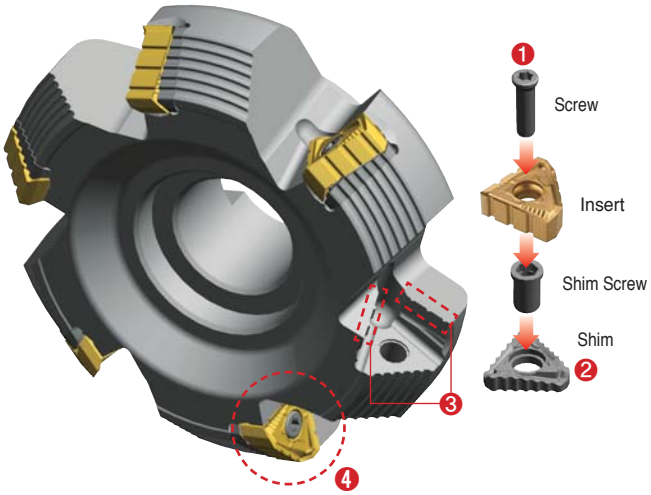
❶ Screw on clamping system

• Simple and strong screw on clamping system

❷ Better rigidity & Stable Assembly system

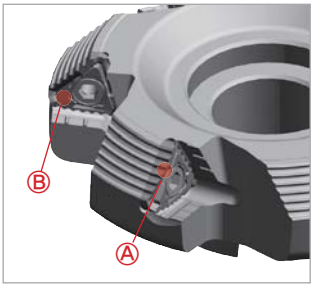
• The shim protects the cutter from insert damage
• High accuracy shim ensures tighter clamping

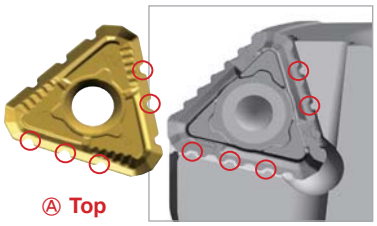


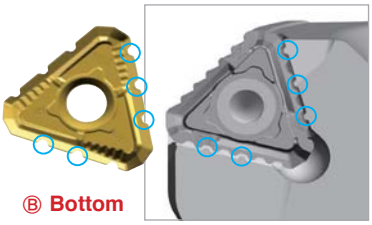


❸ Foolproof System

• Insert serrations match pocket design to prevent improper seating and alignment

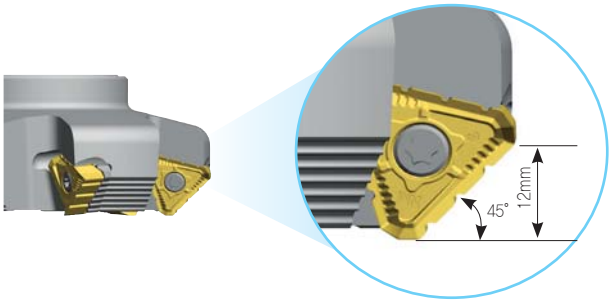


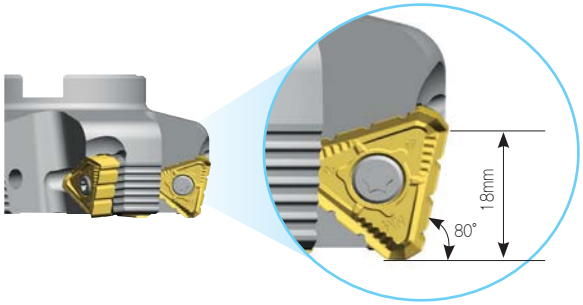




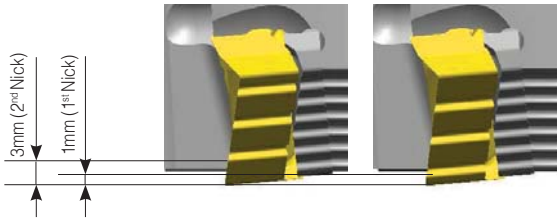
❹ Multi-application system

• Same insert for multi use (45˚and 10˚)





The serrations are effective with a depth of cut larger than 1mm



The serrations are effective with a depth of cut larger than 3mm

Rich Mill RM16

Features

- Economical 16 cutting edges
- Reduces cost in medium cutting
- Wiper insert can be used for good surface roughness
- Optimal matching of the special cutting edge geometry with variety of new grades provides consistence & long tool
- When it is used 16 corners, maximum cutting depth is 5.5mm, but it is used 8 corners, maximum cutting depth is 13mm
- Wiper insert is placed 0.05mm lower than facing insert in cutter
- When feed is bigger than wiper cutting edge length(7mm), 2 wiper inserts are placed in symmetrical position

Chip breaker

Insert		Cutting edge	Features
Aluminum Cutting light **MA**			With sharp edge application, the better productivity has been accomplished, especially for Aluminum cutting.
Light cutting **MF**			Due to low cutting load, it is good for light cutting and difficult-to-cut material.
Hard-to-cut material **ML**			Chip breaker with low cutting load is optimal for machining hard-to-cut materials.
General cutting **MM**			It is suitable design for general milling.
Wiper **W**			It has better surface roughness than MM and MF chip breakers.

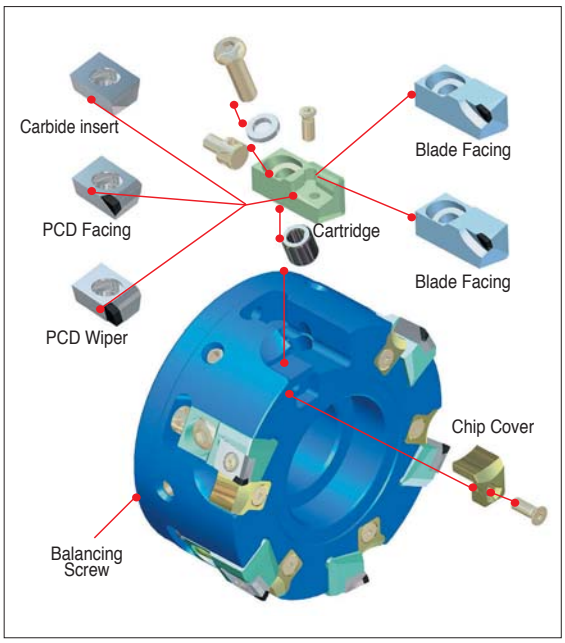
Lighter tool ensures excellent performance in high speed machining.

Aero Mill

- Excellent machining performance can be acquired especially at the high speeds due to the light aluminum cutter body that is 50% of the weight of a conventional steel cutter body
- High speed milling cutter for precise machining
- Special Aluminum material and high rake angle of insert provide rigid & stable machining
- High tolerance surface finishs can be acquired due to the low cutting load provided from the high rake angle
- Balanceable up to G2.5 level



Assembly structure of cutter

- ▶ Increased stability based on cartridge type application
- ▶ Both insert and blade can be available in the same cutter
- ▶ Finishing to roughing can be possible because of wide chip pocket space
- ▶ Roughing and finishing available with carbide, PCD insert application
- ▶ Cutter breakage can be solved by making use of the chip cover

Coolant through system

- ▶ Specially designed coolant through system provides coolant from the center of the cutter to the insert enhances the cooling rate and chip evacuation.
- ▶ Direction of coolant has designed to focus directly to the insert cutting edge to maximize chip evacuation and improve tool life
- ▶ Coolant bolt is applicable up to Ø160, coolant cover is applicable from Ø200 and over. Coolant devices are sold seperately for through coolant system, through coolant arbor has to be used

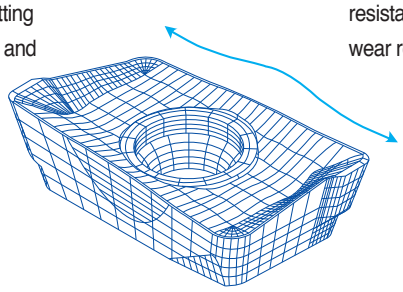
Various applications are available with multi-functional cutters

Alpha Mill

- Innovative curve cutting edge and chip-breaker design ensures ideal 90 degree cutting and lower cutting resistance
- Various applications are available with multi-functional cutters. (Facing, Slotting, Square shoulder milling and etc.)
- Improved insert life time with optimized with each application
- Excellent perfomance ensured at large depth of cut operations due to strong cutting edge and low cutting resistance

Alpha Mill Insert

▶ Long tool life at high speed, high feed and deeper cutting by low cutting resistance and strong cutting edge

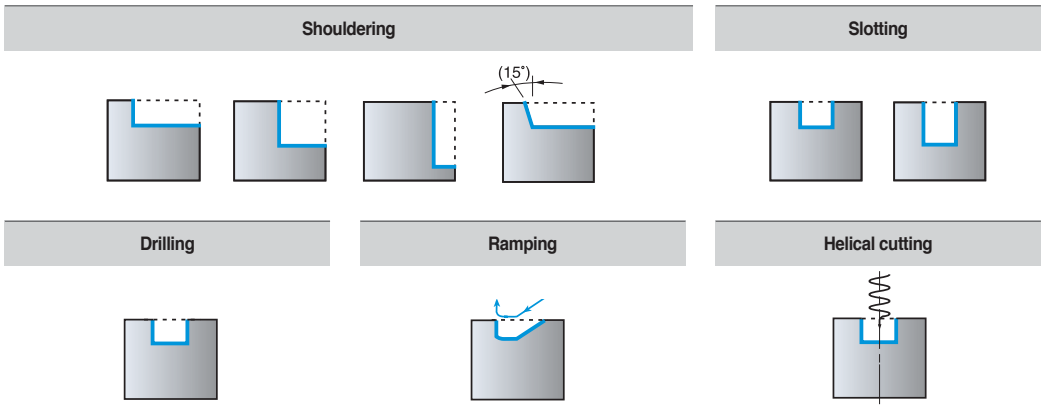


▶ Distinguished features of Alpha-Curve reduce cutting resistance and improve cutting edge strength and wear resistance

▶ Low cutting resistance is realized by KORLOY unique design i.e alpha curve cutting edge and optimal convex and concave design

▶ Highly efficient machining is available by the ideal application of the grade to material

Application example



Alpha Mill APMT-MA, ML

Features

▶ MA : Sharp edge and buffed surface for aluminum machining improve lubrication.

▶ ML : Cutting edge and grades for hard-to-cut materials(Ti, STS, Inconel) ensure superb performance in machining.

Features of Chip breakers

Type	Chip breaker	Cutting edge	Features
Al	MA		Optimal cutting edge and buffed surface for aluminum machining ensure high performance in machining.
Hard-to-cut material	ML		Chip breaker with low cutting load is optimal for machining hard-to-cut materials.

Type	Chip breaker	Cutting edge	Features
Light cutting	MF		Chip breaker with low cutting load and harder cutting edge than ML's are optimal for light cutting.
General cutting	MM		Optimal for milling in general ranges

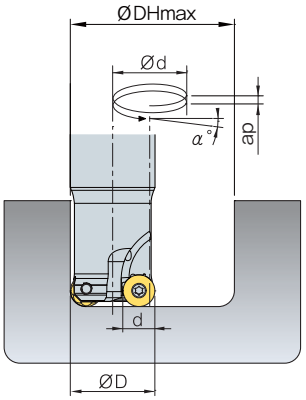
Maximum hole diameter table for Helical machining(ØDHmax)



- ØD = Tool Dia.(mm)
- Ød(Tool Path, mm) = ØDHmin, max - ØD
- ØDHmin(Minimum hole diameter) = ØD × 2 - Insert size(d)
- ØDHmax(Maximum hole diameter) = ØD×2 - 2
- Ramping angle by ap(α°) = $\tan^{-1}\left(\frac{ap}{\pi \times Ød}\right)$

  Helical angle adjusted by ap cannot exceed maximum angle
- ap = Depth of cut

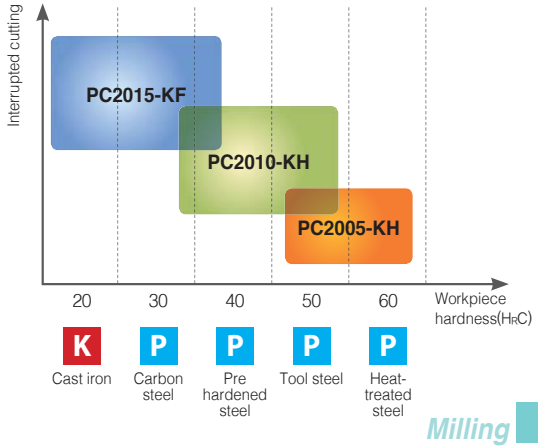
Features of Laser Mill Grades

PC2005	• Extremely high hardness grade • The harmony between improved blade design and strong chip breaker • Optimized for machining heat-treated steel and high hardness steel
PC2010	• High wear resistance and excellent toughness • The harmony between excellent thermal shock resistance and strong cutting edges. • Optimized for machining tool steel and pre hardened steel
PC2015	• High welding resistance and excellent toughness • The harmony between tough grade and excellent cutting edge design • Optimized for machining carbon steel

Application Guideline per Workpiece



Features of KF / KH Chip Breaker

▶ **KF** : Exclusive chip breaker for stable machining of carbon steel with its characteristics of high wear resistance at center part and improved blade design.

▶ **KH** : Stronger insert with the combination of rake angle and relief angle that are ideal for machining high hardness workpiece.

Type	Shape comparison
Standard (For general cutting)	 • Proper to general cutting • Insert shape for uniform performance
KH (For high hardness steel)	 • Center shaper proper for machining high hardness workpiece and uniformed tool life at center part • Improved cutting edge design by higher rake angle(α°) • Lower relief angle(ß°) increases strength of cutting edges than universal inserts.
KF (For carbon steel)	 • Smaller chisel improves wear resistance at center for machining carbon steel. • Improved cutting edge design by higher rake angle(α°) • Longer tool life and better cutting performance with the use of excellent blade design

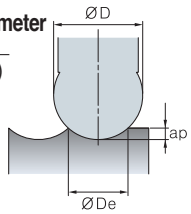
$De = 2\sqrt{ap(D-ap)}$



2. θ°Using : Calculating cutting speed at P point (Cutting speed according to depth of cut when ramping)

• **Formula : Practical cutting speed**

$vc_e = \frac{\pi \, Dsin\theta \times n}{1000}$ (m/min)

$\theta = \cos^{-1}\left(\frac{D-2ap}{D}\right) + (90 - \alpha°)$

3. In case of using ap : Calculating cutting speed at Q point

• **Formula : Pratical cutting speed**

$vc_e = \frac{2\pi n \sqrt{ap(D-ap)}}{1000}$

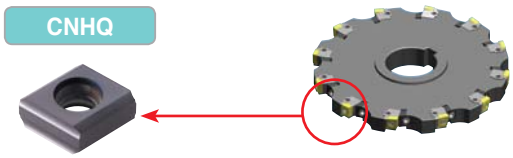
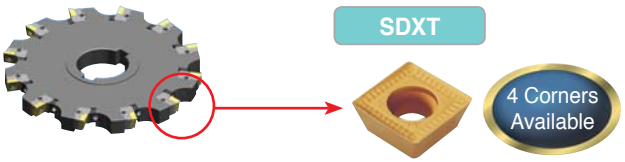
Tangential Type (High rigidity)



- Medium/Roughing
- Excellent performance at medium to roughing range (14~30mm) table operation due to the strong rigidity of the cutter
- Good performance in heavy interruption and deep depth of cut application

Radial Type (Low cutting load)

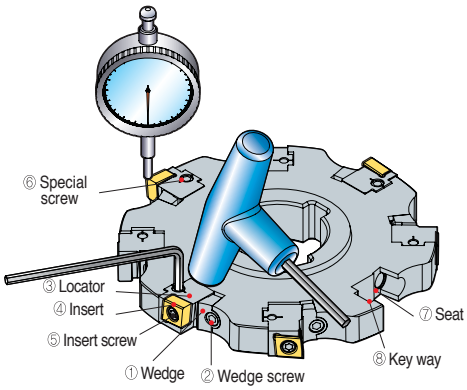


- Medium/Finishing
- Suitable for small width cutting operation (12~24mm)
- 3 dimensional chip breaker provides smooth cutting operation.
- Several chip breakers as per applications are available (MF, MM, FA)
- Economical insert using 4 cutting edges per insert

Insert Features

- Precise adjustable side cutter can control the width of the cutter by 5㎛ unit
- Since the width of the cutter is adjustable up to ±1.5mm, single cutter can cover various cutting width
- Specially designed clamping system of the locator provides excellent rigidity by using elastic deformation of the locator
- Tangential type clamping system of insert provides enough strength can withstand large width cutting operations
- 3-dimensional chip breaker of insert provides smooth cutting with low cutting load at medium to finishing range

Operating manual



How to assemble the adjusting side cutter

1. Clamp ①wedge slightly on ⑦locator-wedge pocket by using ②wedge screw
2. Put ③locator on ⑦locator-wedge pocket along with the ⑧key-way
3. Tighten the ⑥taper screw little bit to set proper position of locator
4. Tighten the ②wedge screw tightly by using 70~80N.m torque
5. After put the ④insert on insert pocket of ③locator, clamp it with ⑤insert screw by using 40~50N.m torque

How to adjust Run-out & Cutting width

1. Settle the adjusting side cutter after cleaning to the jig for measurement
2. Un-screw the ②Wedge screw first, then tighten ①wedge slightly again by using 8N.m torque
3. Adjusting the height of cutting edge by using a dial gauge to set the width of the cutter
4. Tighten the ②wedge screw tightly by using 70~80N.m torque
5. To finish the setting, tighten the ⑥taper screw for strong clamp

High feed cutter with extra pitch for cast iron and light alloy steels

High feed Cutter

- High feed cutter employs extra pitch for cast iron and light alloy steels
- Quick change type for reduction of cutter change time
- Cutting edge chatter is controlled
- Quick change type for cutter size under ø160, 2piece types for cutter size over ø200

Guide of insert setting

▶ Special equipment has to be used to get precise run out with high feed cutter.

Adaptor type	Roller type	Plate type
		- Mainly under ø160 diameter is used in 1piece type - Available for fixed size of cutter and assembling & checking can be done at the same time	- Mainly over ø200 diameter is used in 2piece type - Due to 3 adjustable guide roller, variety size of cutter can be assembled	- Suitable for small size cutter due to the simple tructure - It is unnecessary to unclamp the cutter from the machine, it's possible to reassemble the cutter as it mounted on the machine - You should make plate by yourself

Guide of insert setting in adaptor/roller type

1. Clean the cutter and equipment
2. Pointer should be assembled with same height with cutter
3. Move to each insert on tip seat to end of pointer and tighten(torque 2N.m) wedge.
4. Exchange pointer to dial gauge
5. Measure the run-out totally
6. When a insert over run-out, loosen wedge and adjust run-out. (for roughing 10~20μ, for finishing 5~10μ)
7. Tighten(torque 7-8N.m) wedge
8. Measure the final run-out by dial gauge

Notice) When you clamp wedge too tighten, run-out is getting worse to cutter distortion
When you clamp wedge, you should use torque wrench to set more precisely

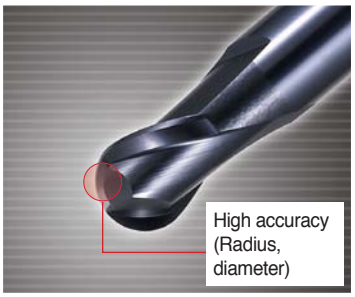
New PVD coating technology for anti-corrosion and wear resistance

H-Max

- H-max can be used for pre-hardened steel and heat-treated steel
- H-max guarantees highly accurate machining (diameter and radius)
- New PVD coating technology improves anti-corrosion and wear resistance

HPBE



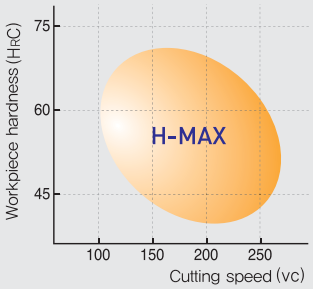
HPRE

• **Tolerance**
Diameter : 0~-0.015 Radius : 0~-0.005

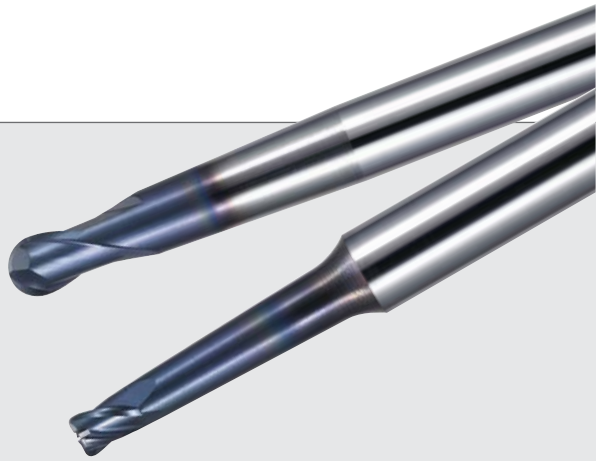
▶ Ultra fine grade for tougher edge and less chipping

▶ Combination of the new PVD coating and the hardened anti corrosion substrate guarantees excellent performance

Application area (Ball. Radius type)



• Cutting speed vc(m/min)
※ by diameter



Test examples

■ **Joint mold core machining (STD11 HRC54~59)**

- Workpiece : STD11 HRC54~59
- Cutting condition : vc =170(m/min), vf=800(mm/min)
  ap =0.2 ae=0.5, oil mist
- Tool : HPBE2080 PC203F

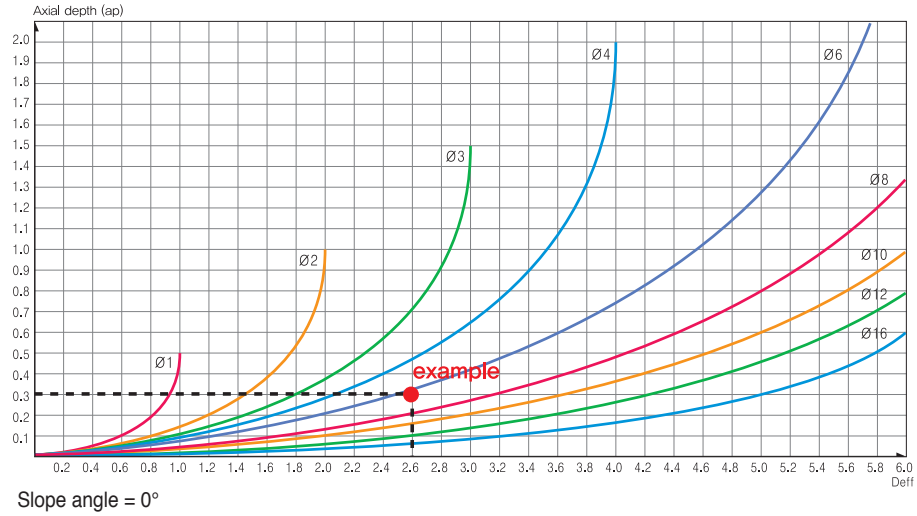
Cutting speed formulas (Ball Endmills)

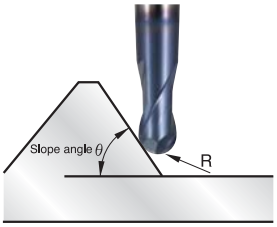
- Efficient cutting speed Veff = π × Deff × n/1000 (n=min^{-1})
- Efficient diameter Deff calculation formula : Deff=($2\sqrt{ap(D-ap)} \times \alpha$)
  D=Ø(Tool diameter), Deff=Efficient diameter
- Efficient cutting speed formulas : When slope Ø is 0° Veff = π × Deff × n/1000
  Deff = Efficient, diameter Calculate Deff as ap with various ball endmills

α :	α = 1	Slope angle θ = 0°
	α = 1.2	Slope angle θ = 7°
	α = 1.5	Slope angle θ = 15°
	α = 1.7	Slope angle θ = 30°
	α = 2.17	Slope angle θ = 45°
	α = 2.3	Slope angle θ = 60°

Cutting speed formulas (Ball Endmills, Slope angle = 0°)



Slope angle = 0°



Ex) **Diameter** : 6mm, ap=0.3mm,
Deff=2.6mm, N=14,000(min^{-1})
Slope angle 0° : Veff = 113.7(m/min)
Slope angle 15° :
Veff = 113.7 x 1.5 = 170.6(m/min)

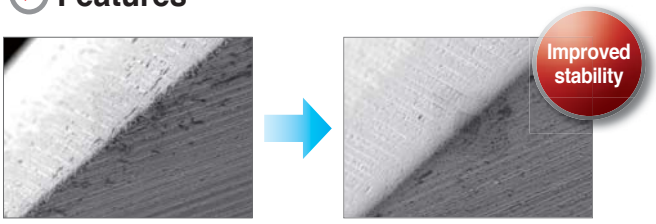
Endmill series for general cutting

Z Endmill

- Endmill for general cutting of various workpieces under HRC45 (carbon steel, alloy steel, cast iron, pre hardened steel, etc.)
- New shape and coating improves performance and tool life
- Optimized blade design for less chipping and stable machining

Features

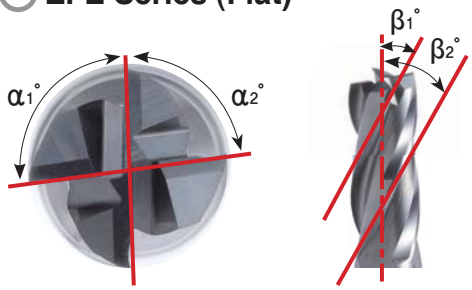


before

After special edge treatment

- **New grade(PC315E)**
  - Fine substrate and lubricative coating guarantee excellent performance at high speed and high temperature.
- **Special edge treatment**
  - Special cutting edge design was applied for less chipping and longer tool life
- **High accuracy with tolerance-h5**
  - High quality production system enables tolerance-h5 throughout the whole series.

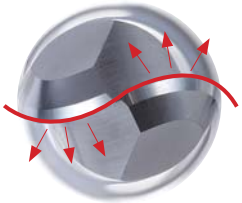
ZFE Series (Flat)



$\alpha_1^\circ \neq \alpha_2^\circ$, $\beta_1^\circ \neq \beta_2^\circ$ Irregular indexing & helix

- Irregular indexing & helix prevent chattering and improve surface

ZBE Series (Ball)



Cutting load is dispersed

S shape of ball

- The S shape of ball disperses cutting loads
- The tolerance of ball R is under ±0.005mm

- Workpiece should be clamped rigidly. In case of vibration, reduce R.P.M and feed rate by the same ratio

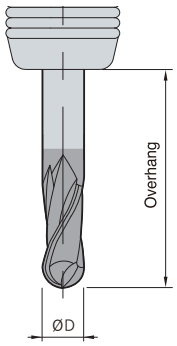
Cutting condition by overhang

■ Cutting conditions of the shank taper type in case of being clamped at neck.
➔ When the overhang is increased by 1D, decrease R.P.M and feed 10%.

■ In case of the straight type adjust conditions according to the overhang.
➔ Ex) When the overhang is 3D and is increased by 1D, decrease R.P.M and feed 10%.



Notice

■ Cutting conditions are up to the machine's condition and the shape of cutting.
■ Use cutting fluid that is proper to the workpiece and produces few temperature reaction.

Stainless steel machining

- Low thermal conductivity of stainless steel alloy causes conducting heat to the tool and fracture and chipping.
- Stainless steel alloy machining gets easily wear and high cutting resistance.
- High temperature in stainless steel alloy machining lowers cutting conditions and decrease the quality of surface roughness.

Trouble shooting for stainless steel

- Get low cutting conditions.
- Get deeper ap than the work hardened layer and use tools with sharp cutting edge.
- Use coolant.

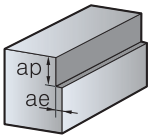
■ Side milling (under HRC45)
· ap≤1.5D · ae≤0.1D



■ Side milling (over HRC45)
· ap≤1D(Max : 1mm)

• Above table based on side milling, when it enters to ae direction, you should apply reduced cutting condition
• When it enters to ae direction, for finishing you should increase revolution speed and feed in the table

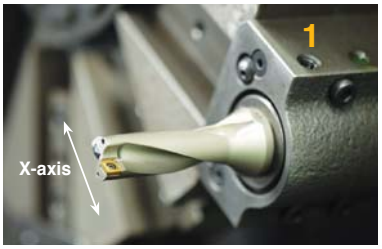
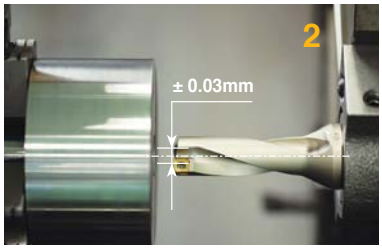
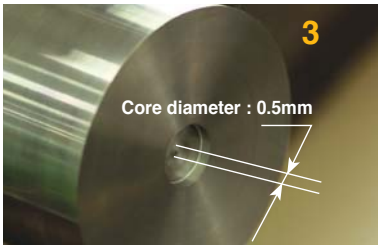
Notice for setting the drill in the lathe



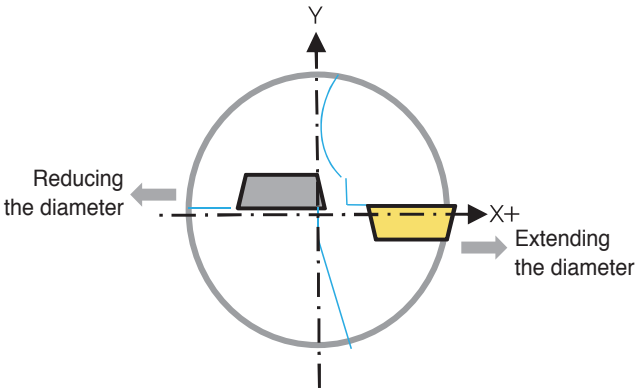




• Set the peripheral insert parallel to the X axis. (based on the side lock)
• If the machined core is 0.5mm after machining 5mm, that is the proper setting.

※ Please make sure that the location of the side lock could be different depending on manufacturers of machine.

Range of adjusting machining diameter in the lathe



- In machining in the lathe, the King Drill can extend and reduce the machining diameter with moving to the x axis. Please refer to the table showing the range of adjusting drilling diameter below.
- The more the drilling diameter is extended or reduced, the more the drill loses drilling balance. In this case, reduce the feed or cutting speed in machining.
- Reducing the machining diameter excessively could damage the holder.

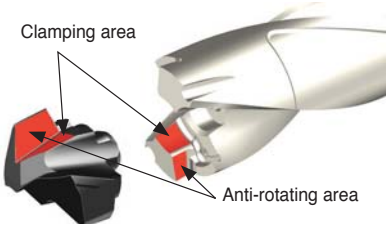
▶ **One Step Clamp System** ➞ Easy and quick tool change with good repeatability



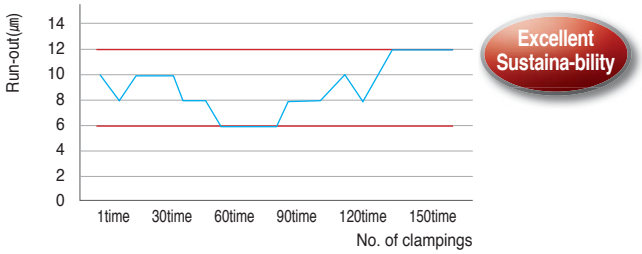
- **Clamping area** : Easy and fast tool change
- **Anti-rotating area** : Performs as a stopper
- Clamping and anti-rotating area make an acute angle to prevent insert rotation while machining

Durability test

- **Workpiece** : SCM440(HRC22)
- **Cutting condition** : Drill dia.(mm) = Ø15.0
  vc(m/min) = 90
  fn(mm/rev) = 0.25, ap(mm) = 60
  wet
- **Tools :** **Insert** TPD1500CP(PC5335)
  Holder TPDC5D-15020-75

➞ After using 40 inserts, the setting run-out remains below 15㎛

Sustainability test



➞ After clamping 150 times, the drill run-out remains

Cutting Performance

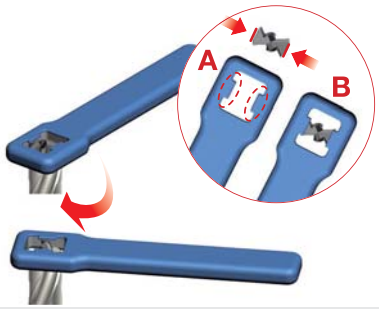
• In case of 8D, reduce the cutting condition 40~50% lower than above after machining the beginning of hole(1.5D).
• In case of interrupted machining, reduce the feed to 0.1~0.15 arround the interrupted part.

How to Make Good Insert Clamping

① Clean the mounting seat with air or cloth.

② Put an insert on the holder.



③ A part of wrench and B part of insert must be parallel to each other before clamp the insert.
Turn the wrench clockwise to finish clamping.

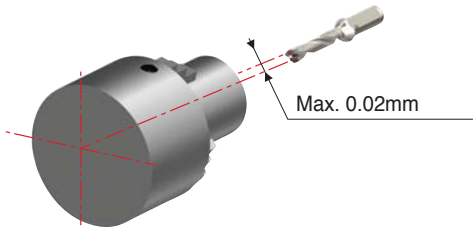
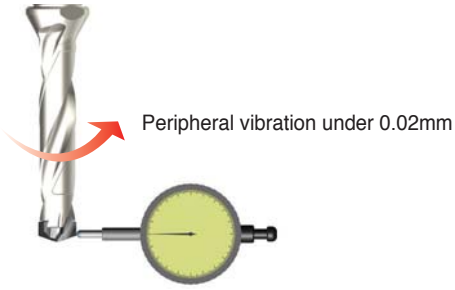
Precautions When Setting



Setting of the horizontal equipment



Setting of the vertical equipment

Precautions When Drilling

Ramping	Machining verlapped panels	Plunging	Boring
			1. A slope inclined more than 6° is not allowed. 2. When entering, reduce the feed to 30~50%.	1. Space between panels affects chip evacuation problem. 2. Do not make space between panels.	Not allowed	Not allowed

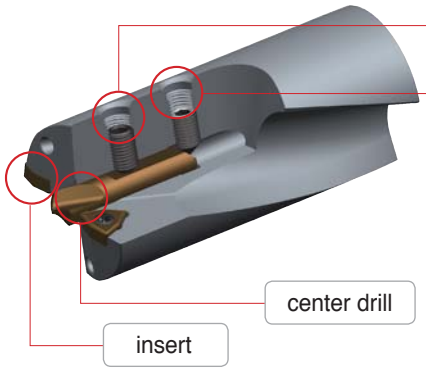
How to clamp the drills

Feature of corn-point system



- ▶ Convenient and quick adjustable heights when inserting the center drill
- ▶ In case the center drill brakes while in usage, it can be replaced with the bolt for adjusting cone point.
- ▶ The bolt for adjusting cone point prevents chattering on the center drill.

Clamping

1. 
   Place a center drill.

2. 
   Clamp insert and cartridge.

3. 
   Adjust the center drill with the bolt for adjusting cone point.

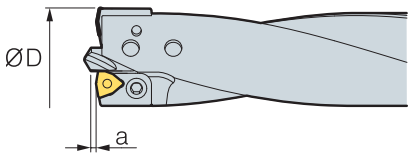
4. 
   Clamp the center drill firmly with fixing bolt.

5. 
   Reassure the clamp with bolt for adjusting cone point.

※ Caution
(1) Use safety covers for your safety when clamping the center drill and insert.
(2) When machining, be careful of the drill disk.

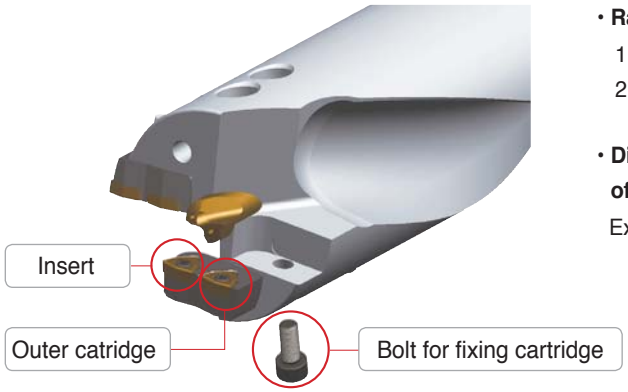
Length of the 'a' part of center drill

The length of 'a' being too short can cause badsurface finish or high cutting load.
On the other hand, the length of 'a' being too long can make tool failure and chattering while drilling.



Diameter (ØD)	Length of the 'a' part of center drill		
	Steel	Alloy steel	Non-ferrous metal
25~30	1.2	1.0	1.5
31~40	1.5	1.3	1.8
41~50	1.8	1.5	2.2
51~59	2.2	1.8	2.5
60~75	2.5	2.0	2.8
76~80	3.0	2.5	3.5

Adjusting diameter of cartridge type drill



- **Range of adjustable drill diameter**
  1. Single cartridge type(Drill diameter Ø41~Ø59) ···› -1.0mm
  2. Dual cartridge type(Drill diameter Ø60~Ø80) ···› -5.0mm

- **Diameter of the standard drills is provided with maximum size of standards.**
  Ex) WPDC6570-40-6.5 ···› Drill diameter 70.0mm

- Disassemble a cartridge from the holder by loosening the bolt fixed for outer cartridge.
- Machine after calculating the hole size on the side of the outer cartridge.
- Trim the sharp part after machining.
- Clamp the bolt for fixing cartridge without any gap in between the holder and the machined outer cartridge.

Ex) How to adjust drill diameter to Ø66.0 machining with WPDC6570-40-8
···› To make the drill diameter of outer cartridge to Ø66.0, machine 2.0mm. (Ø70.0-Ø66.0 = 4 ···› 4÷2 = 2(radius))

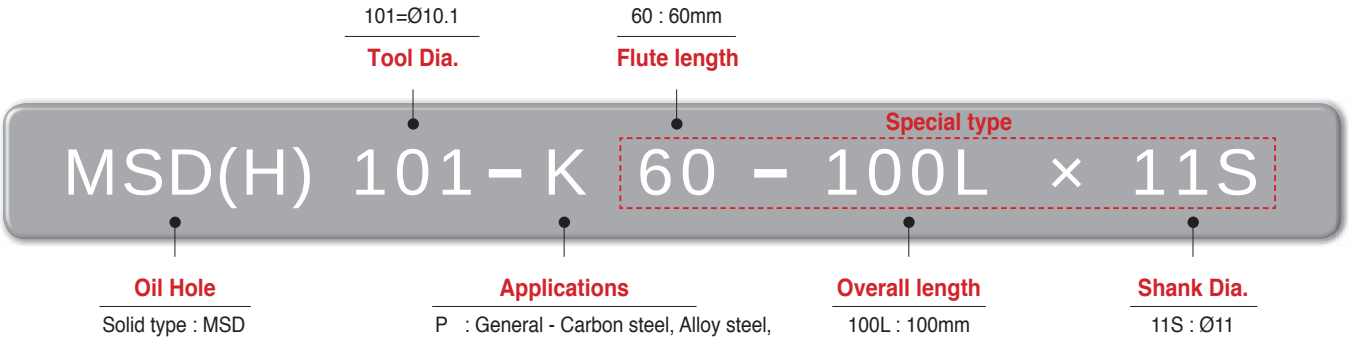
Various designations of MSD & MSDH enable to do any drilling

Mach solid drill

Code system



Features

▶ Optimally designed chip pocket
• Wide and deep chip pocket improve chip control to minimizing friction during an operation

▶ A curvilinear edge
• A curvilinear edge offers excellent wear resistance and shock resistance by dispersing the cutting load

▶ 3D, 5D, 7D Standardization
• For example) diameter Ø10mm and depth 30mm and outer coolant system, Take MSD100-3P!

▶ MSD : Solid Type & MSDH : Through oil-hole type
• Various designations of MSD & MSDH enable to do any drilling

▶ Low cutting resistance edge
• The MSD & MSDH low cutting resistance edge guarantees a better surface roughness and chip control while allowing the drill to center itself

▶ Rigid neck of drill
• The new design of this drill has an increased rigidity at neck.
This prevents breakage of neck on the drill

▶ Line-up as per workpiece
• P : Steel (Carbon steel, Alloy steel)
General - Carbon steel, Alloy steel, Stainless steel, Cast iron Low cutting resistance edge, Ultra micro grain substrate, K-Black coating

• K : Cast iron, Die casting, Ductile cast iron
Coolant system : Through / Outer(MQL)

• M : Stainless steel, Reduced built-up edge and cutting resistance
Coolant system : Through / Outer(MQL)

• N : Aluminum(Carbide drills), Medium & Low speed cutting performance
Coolant system : Through / Outer(MQL)

• ND : Non-ferrous metal, High speed, High efficiency performance
Improved welding resistance due to applied DLC coating
Coolant system : Through / Outer(MQL)

Features

Low cutting resistance edge

- Uniformity in cutting edge treatment : Reinforces equalized quality in every machined part
- Protecting workpiece : Low cutting resistance edge operates well in medium to finishing machining, workpiece protection and good surface roughness
- Better chip breaking : Based on our cutting processes studies, our drills assure better chip breaking in high or low speeds

Features of TiAlN Coating

- Decreasing of micro particle → Chipping free from macro particle
- Better hardness and toughness → Covering wide cutting speed and feed rate range
- Special coating layer at most-outer edge → Special TiAlN with better lubrication guarantees welding resistance
- Pre-treatment before coating process → Higher adhesion by pre-treatment

n : Revolution per minute(min^{-1}) vf : Feed per minute(mm/min) D : Drill Dia.(mm)
vc : Cutting speed(m/min) fn : Feed per revolution(mm/rev) π : 3.1416

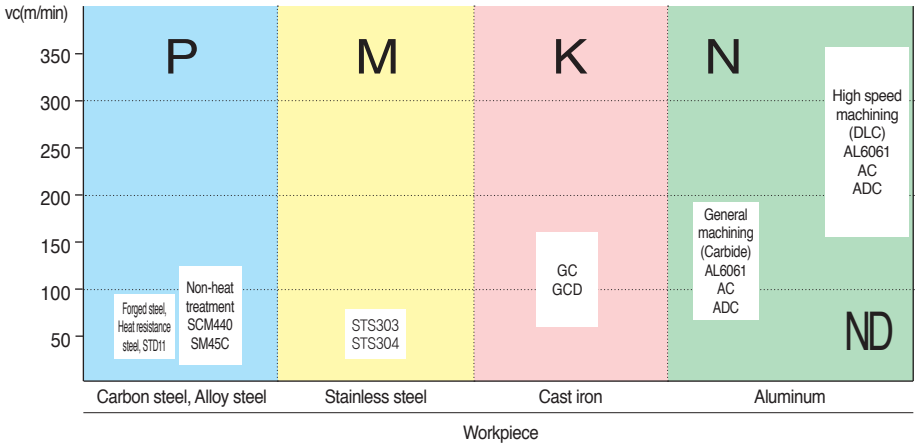
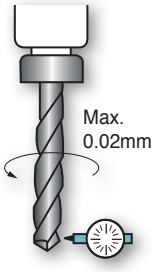
Note) Recommended cutting speed is one of the important factors for the drill performance. In case of using further cutting speed or feed rate than recommended conditions to improve the productivity, please apply it after enough tests because it could be occurred some problems like early wear, built-up edge, chipping, fracture, etc.

Recommended cutting condition by series

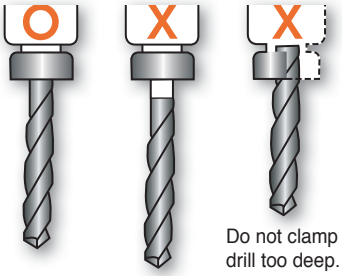


Setting of drills

Outer tolerance

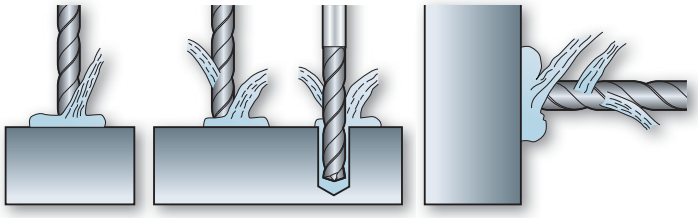


Setting condition



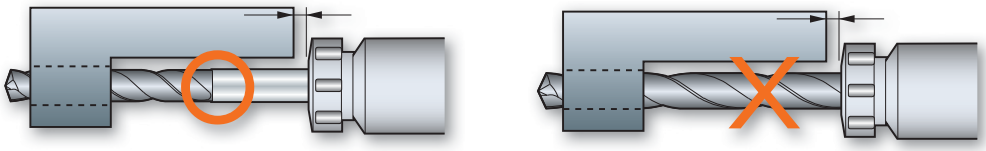
Do not clamp the drill too deep.

Coolant (External system)



To improve machining method

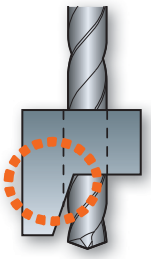
Machining for strength of wheel



Using short flute lengeh

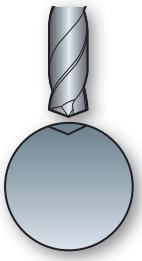
Improvement of drilling

Piercing stage



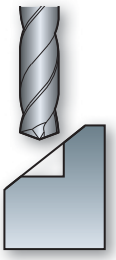
Decrease feed 1/2

Circular surface



First, center drilling with large point angle

Inclined surface



First, facing with endmills

Features

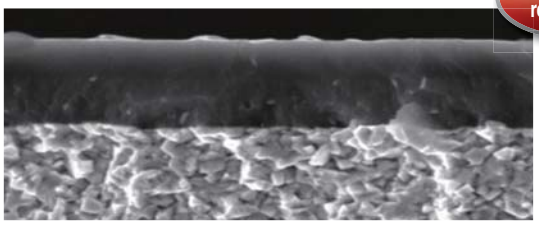
Cutting edge and flute shape

- Straight cutting edge provides better rigidity.
- Excellent chip evacuation due to wider chip pocket and improved flute surface roughness
- Double margin secures machining stability.

Cutting edge shape

New grade(PC315G)

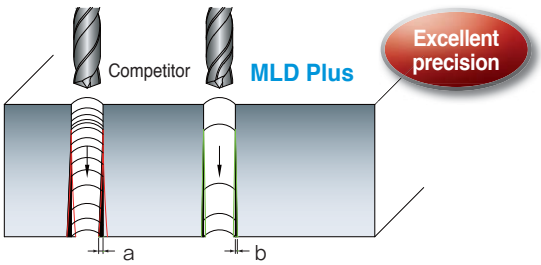
- Ultra fine substrate and new coating applied
- Lubricative coating layer improves chip evacuation with lower frictional resistance.
- Longer tool life due to higher wear resistance



PC315G

Degree of machining precision

- Improved machining precision
  - Bent holes reduced
  - Inside hole surface roughness improved
  - Hole size uniformity increased
- Improved point shape
  - Precise location secured



Reduced bent holes compared to competitors (a > b)

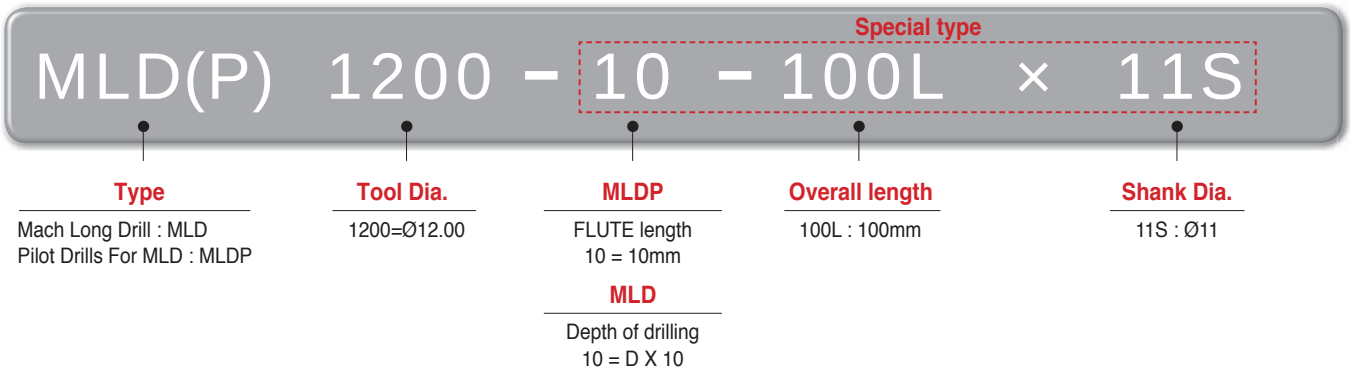
Stable deep hole drilling with specially designed low cutting resistance

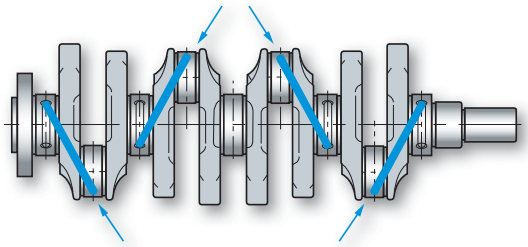
Mach Long Solid Drill

- Over 20D deep hole drlling is possible without step drilling
- The stable hole drilling due to specially designed low cutting resistance
- Special chip pocket has designed for effective chip evacuation
- Optimized design for drill rigidity to prevent the bending of the drill when entering operation
- The lubrication & thermal resistance of coating has been increased by adapting new TiAlN

Code system



Mach Long Drills - Deep hole drilling



Application example (Oil hole for crank shaft, 20D)

Mach Long Drills are ideal for.....

- ▶ Deep and inclined hole drilling of crank shaft
- ▶ Deep hole drilling of cam shaft
- ▶ Deep hole drilling of mold and machinery
  → Deep hole drilling aspect ratio over 15D

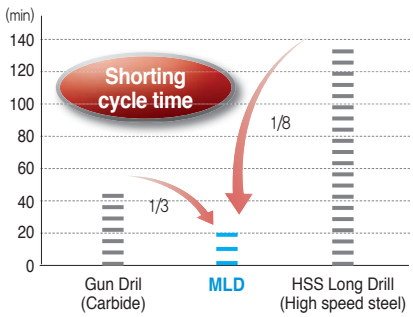
Advantages of MLD

- ▶ Shorting cycle time for better productivity
- ▶ Tool guide bush is not required
- ▶ Reduce idle time by prolonged tool life
- ▶ Green coolant solutions(MQL) to protect environment

MLD productivity : MLD0680-20 (Ø6.8mm x 140 x 170L x 7S)

Tool	vc(m/min)	fn(mm/rev)	n(min^{-1})	vf(mm/min)	Coolant	Step operation
Gun Drills (Carbide)	100	0.04	4,683	187	Through coolant oil	No required
High Speed Steel Long Drills	15	0.10	703	70	Outer coolant oil	15mm / 9times
Mach Long Drills	80	0.14	3,747	525	MQL- Air 0.5MPa, Oil 20cc/h	No required

Cycle time

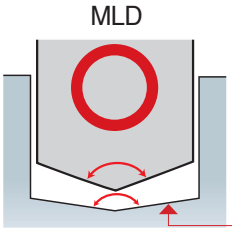


Advantages of MLD against conventional drills

- ▶ Decreasing cycle time up to 1/3 ~ 1/8 times
- ▶ Increasing productivity by process reduction
- ▶ It is easy to reduce running cost
- ▶ Improving of effective working condition
- ▶ Drill guide bush is not required

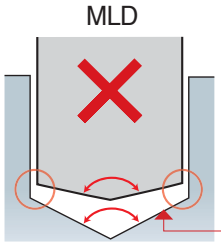
Function of MLD & MLDP

Relationship of point angle between MLD & MLDP



Point angle of MLD < Point angle of foundation hole
→ Stable machining

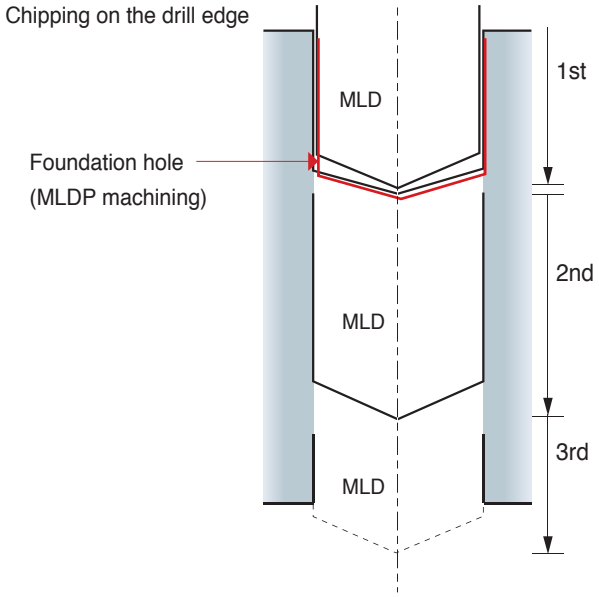
Large point angle of Pliot Drill : Stable condition



Point angle of MLD > Point angle of foundation hole
→ Chipping on the drill edge

Small point angle of Pliot Drill : Unstable condition

To make the optimal of MLD



1st. Pliot drilling
- vc(m/min) = Normal
- fn(mm/rev) = Normal

2nd. Deep drilling by MLD
Approach the drill 1mm less than the depth of MLDP drilling.
- vc(m/min) = 15
- fn(mm/rev) = 0.5

2nd MLD drilling (Machining stage)
- vc(m/min) = Normal
- fn(mm/rev) = Normal

3rd MLD drilling (Piercing stage)
- vc(m/min) = Normal
- fn(mm/rev) = Normal feed / 2

Notice

Unsuitable drilling

- Avoid the inclination or unevenness of entering and piercing section of hole as possible
- Reduce the feed 0.1 ~ 0.15mm/rev when drilling at inclined and unevenness

Clamping of workpiece

- In case of wide flat panel or rotation by horizontal component, please clamp to be prevented bending of central part of workpiece for high efficiency

Carbide Drill

One of the most important aspects of hole-drilling is hole precision and the tool life of the drill.
These carbide drills are produced with a super fine exclusive substrate from Korloy designed to meet stress, hardness, and resistance to plastic deformation requirements of today's machining

- Long tool life by improving wear resistance and toughness for small hole drilling(Ø1mm~ Ø4mm)
- Increment of productivity by come true high feed because of specially designed cutting edge to low cutting resistance.(Ø4~ Ø15)
- Available to various workpiece as cast iron, non-ferrous metal, etc.
- Guarantees excellent chip evacuation and surface roughness by specially designed flute and high rigidity of drill

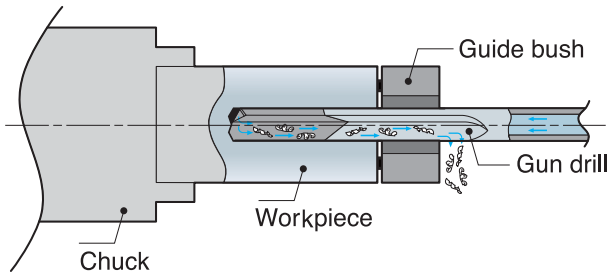
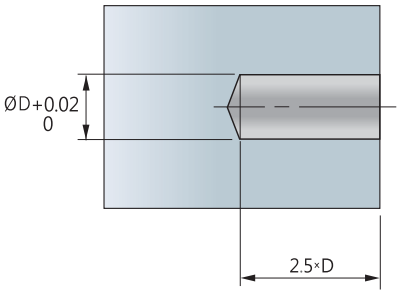
Application of Gun Drill on exclusive machine



- The guide bush is necessary for centering before gun-drilling.

Application of Gun Drill on machining center

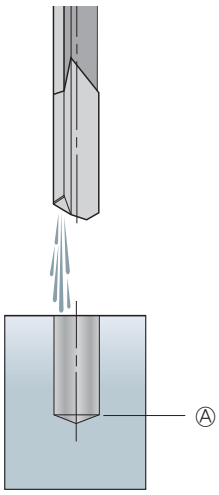
1 Machining of a pilot hole



1. A pilot hole is necessary in machining on a machining center instead of a guide bush.
2. The diameter of the pilot hole should be 0.01~0.02(H7) larger bigger than one of the Gun Drill diameter and the depth of drilling should be about 2.5×D.
3. Use Mach Drill(MSD) for machining of a pilot hole.

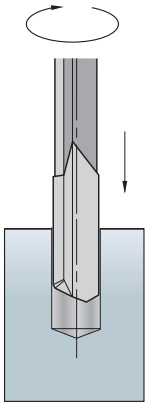
MSD

2 Moving the Gun Drill to the pilot hole



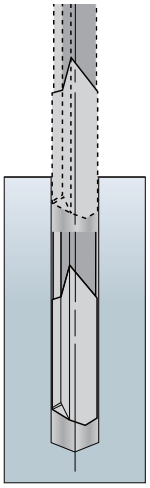
1. The Gun Drill should not drill before entering into the pilot hole.
2. Coolant is necessary for gun drilling.

3 Start Gun Drilling.



1. Rotate the spindle.
2. Machine with drilling to vertical axis.

4 After gun drilling



1. Return the drill.
2. Stop drilling and supplying coolant.
3. Remove the Gun Drill.

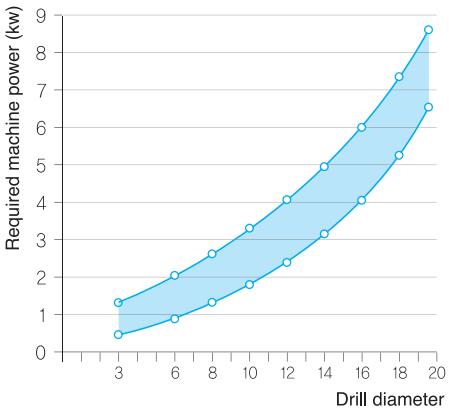
Technical information

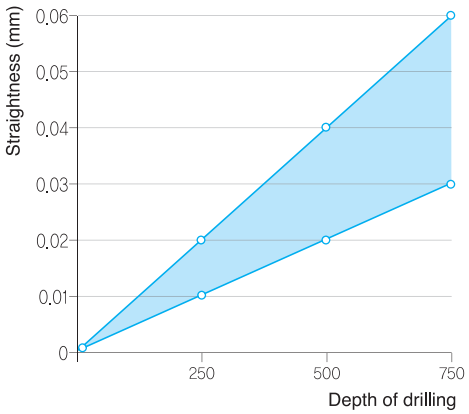
The factors below determines the straightness of hole.

- Drill diameter and depth of drilling
- Cutting condition and kind of application
- Kind of workpiece and machine
- Drill bush

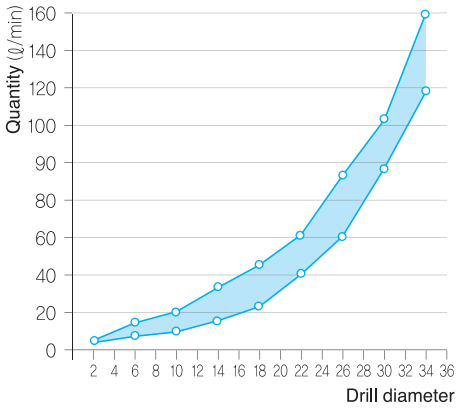
Required machine power



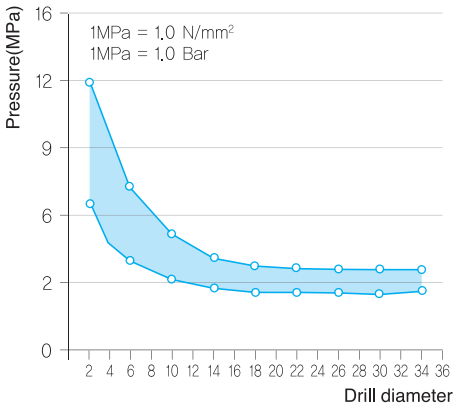
Straightness



Quantity of coolant



Pressure of coolant



The above graph shows general information and it is changeable depending on kind of tool, workpieces, and cutting conditions etc.

- **Pressure and quantity of coolant** - High pressure of coolant ensures excellent chip evacuation and cooling the cutting edge.
- **Use a filter for removing impurities** - The diameter of a filter should be less than 20㎛. Impurities could make bad flow of coolant, wear on a tool, and high load on the cooling pump.
- **Temperature of coolant** - Proper temperature of coolant : 20°C~ 22°C / Do not use coolant at 50°C above

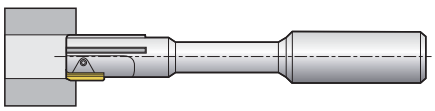
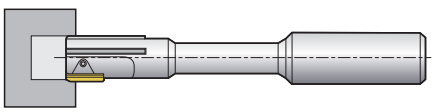
Application

Throughout hole machining(IRT type)



Stuffed hole machining (IRB type)

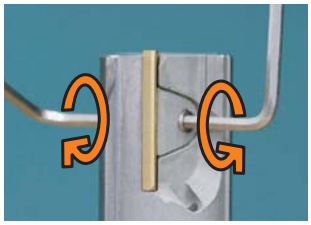


How to set an insert

1

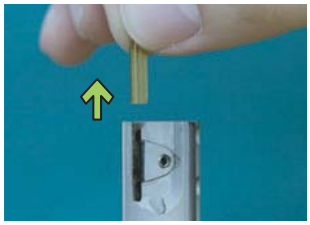
1. Screw the wedge screw counter clockwise with the exclusive wrench.

2



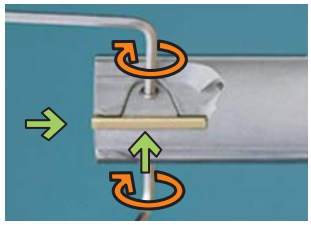
2. Screw the clamp screw.
   ① Top side : counter clockwise
   ② Lower side : clockwise

3



3. Remove the insert and clean the pocket.

4



4. Put the insert up to the edge stopper and clamp the insert.
   ① Top side : clockwise
   ② Lower side : counterclockwise

Exclusive fixture

- ▶ Designation : KIRSD-210
- ▶ Maximum diameter of reamer : Ø60×210mm
- ▶ The fixture is also available for setting special reamer and mono tool.
- ▶ Special reamers (out of maximum setting range) are available quotation.

How to set an insert with fixture

1

1. Adjust the gauge to '0'.

2

2. Rotate the reamer for the insert to touch the gauge.

3

3. Set the back taper and adjust the insert height with screw the wedge screw.
   ① Top side of insert : +0.015 ~ +0.020mm
   ② Bottom side of insert : +0.005 ~ +0.010mm
   ③ Back taper : 0.010 ~ 0.015mm

Back taper

- ▶ Ensures low cutting load and excellent surface finish with good chip evacuation.
- ▶ Inaccurate back taper could cause unstable machining with wear of insert.
- ▶ The size of back taper of insert down side should be less to 0.010~0.015mm than one of insert upper side.

Insert setting with a micrometer

• Lathe with both centers or Bench center are also available.

Notice : The setting with a micrometer is not recommended due to chipping on the cutting edge.

KORLOY Ultra-Fine Grades "F-Series"

Features

In general, when we compare cemented carbide to high speed steel, cemented carbide has higher hardness but is more brittle than high speed steel. To neutralize the difference, KORLOY has developed an ultra fine cemented carbide grade "F-Series"±(WC size under 0.5㎛). It provides improved toughness and plastic deformation resistance against cemented carbide having coarse grain sizes. The main coverage for ultra fine cemented carbide is endmilling of difficult-to-cut materials like high temp alloys.

● Micro Structure of "F-Series"

FA1	FCC	FS1
		Since it is a grade focused on toughness, it is possible to make endmill, side cutter, gun drill, reamer etc. It has superior quality on toughness and anti built-up edge properties.	It has been modified from FA1 to increase thermal shock resistance, thus FCC has proper properties to machine stainless steel and hard to machine materials at medium to high speed milling.	As a ultra fine grade having high hardness and superior toughness at the same time, it is the 1st recommended grade of KORLOY to make sharp cutting edge to cut difficult-to-cut material.

TOOLING SYSTEM

For high speed machining

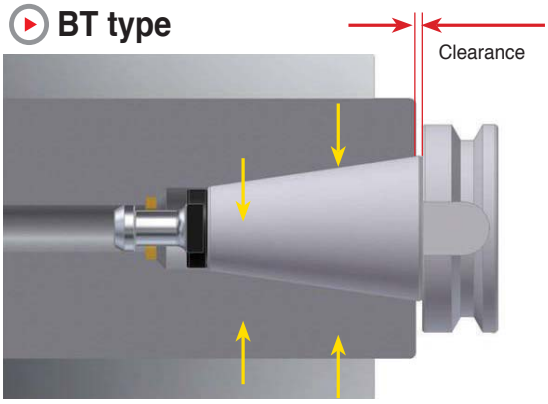
DBT Series

2 face constrained system of taper and shank face for excellent surface roughness and high quality finish in heavy cutting at high speed

Features of 2 face constrained system

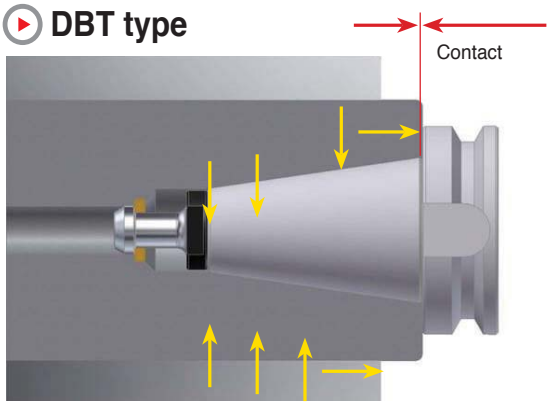
- Stable machining can be possible at high speed
- Improvement of tool-life for machine spindle and cutting tool
- Prevention for corrosion of taper porsion of both machine spindle and tool holder by heavy duty machining vibration
- Guarantee for the most suitable machining and high accuracy

BT type



The clearance between spindle and face of shank

DBT type



Perfect contact of both faces
Better precision / less vibration

Higher stability and precision

Stability and precision increase due to the close contact between taper face and wide external diameter of flange at DBT shank than at BT shank

Shank	Taper		Flange

BT40	Ø44.4	→	Ø63

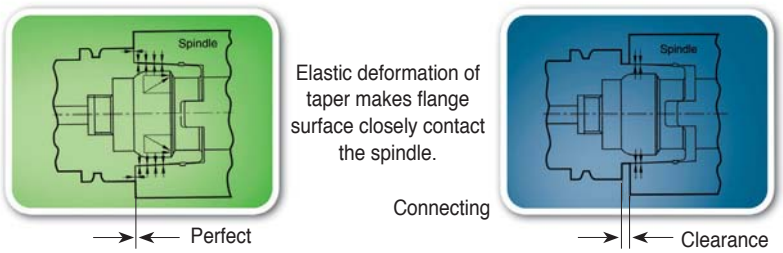
HSK Tooling System

HSK 2 Face Constrained Toolholder

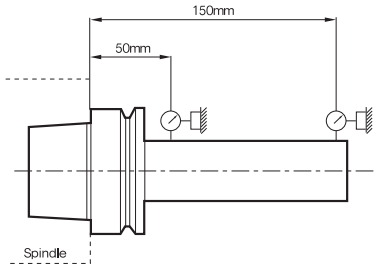
The 7/24 taper shank for multi-purpose has been pointed out that its performance is inappropriate in terms of repeatability, joint stiffness and high speed machining.
Drawbacks of 7/24 taper shank had been eliminated by using new two face contact.

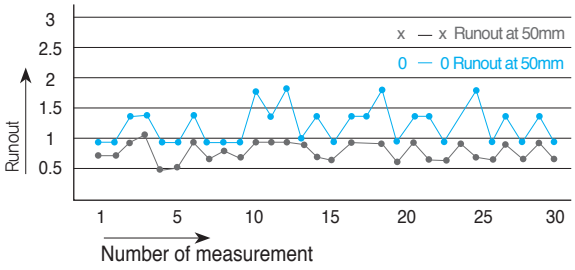


HSK shank -Perfect 2-surface constrained System

Excellent Repeatability-Run out Accuracy

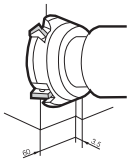
As taper of holder will deform elastically following the profile of the spindle shape, there is no eccentricity between the spindle and the other. Also, due to perfect face contact between flange surface of the holder and spindle face, bending strength of the holder is very high, which makes radial and axial and accuracy very high.

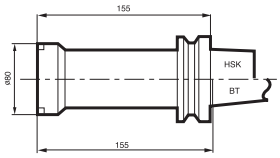


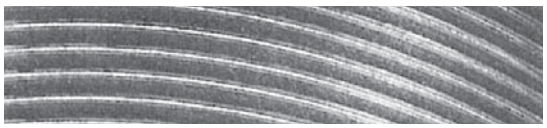


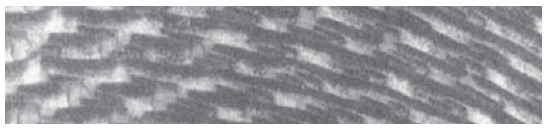
High Rigidity Against Bending Load

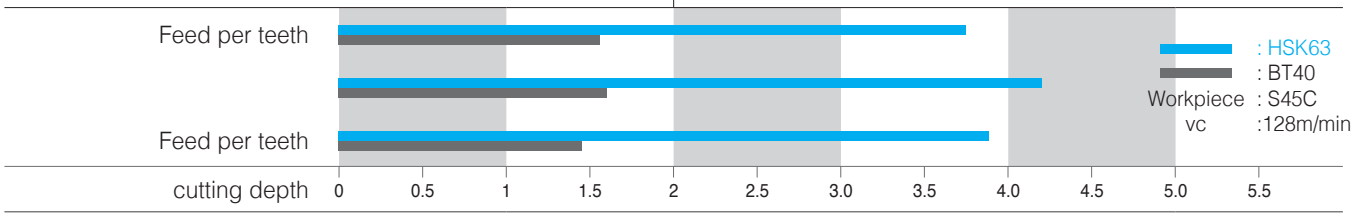
HSK 63	BT 40
		





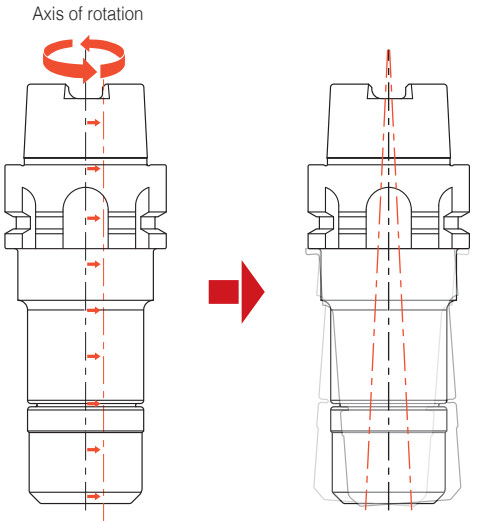






Balancing System

Imbalance



▶ Cause of imbalance
Imbalance occurs due to the asymmetry of tool geometries and spindle run-out

▶ Difficulties of imbalance
Shorter tool life, inferior surface roughness and noise are caused by vibration during rotation and damage on spindle bearing

▶ Need for balancing
Balancing is needed to prevent unbalance for better surface roughness, precision and tool life

※ A case that the tool's center of gravity deviates from the rotation axis

The most optimal accuracy at high speed

1. Without bending from rotation of an unbalanced load, High accuracy and rigidity are maintained
2. Excellent Balance(≤G1.0 or 0.5 g·mm/kg)
3. Tool life, surface finish, dimension of accuracy and productivity can be realized at high speed

Hydraulic expansion chuck

DHE Series

- Ideal for mold making and machining automobile components & precise parts due to high precision machining
- Improved surface roughness due to vibration proof by hydraulic chamber
- Reduced replacement time and tiredness of worker with the use of T wrench for removal
- Applicable shank diameter : D3-32

Code System

BT40 - DHE 20 - 140

Spindle	Hydraulic Expansion Chuck	Max. Chucking dia.	Length

Features

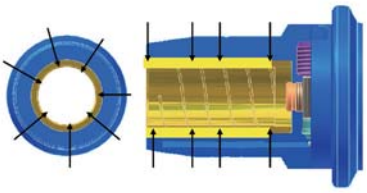
High accuracy provides long tool life due to reduced wear and hydraulic room enhances a surface roughness by lessening vibrations.

- RUN OUT : under 5㎛
- L = 3 x ØD
- Shank : Tolerance of ØD : h6

Internal sealing structure(Durability)

• Internal sealing system protects the chuck against dust, cutting oil, lubricant and chips getting into it.

- Maintaining clamping force and accuracy for a long time



SHANK	Grade	Max.rpm

GER Collet_GER

GERC New

- Corrosion resistant collet to micro unit
- High tech coating for long lasting precision
- Longer tool life and higher productivity

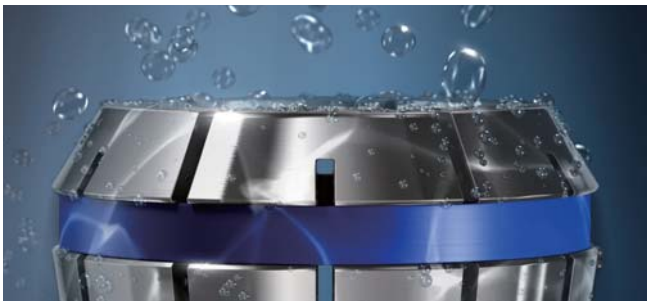
Code System

GERC - 16 6.0 - HP

Spindle GER Collet	Clamping Range	HP : Precision Non : General	HP : Precision Non : General

Special coating technology

Unlike GERC collets, Conventional non-coated collets have the following features :
Non-coated collets are affected by corrosion due to high humidity, cutting fluid, cleaner, salt, gas and many other factors, which in result deteriorates whole quality of machining.



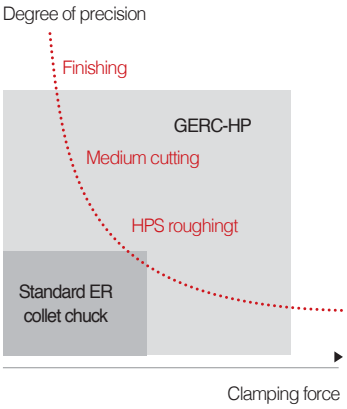
When a collet gets rusty, the tool life is shortened and precision considerably decreases. To prevent this problem, surface treatment by micro unit was applied to GERC collets for effective protection and long lasting precision

Two samples of collets after 4 months of use :
Left : Non-coated, Right : GERC collet

GERC-HP

A precision type collet chuck is expensive than standard one, but still it has more advantages in long term cost and efficiency. Using GERC-HP can minimize pricy reworking due to smaller tolerance with maximum precision.

Precision type collet 2㎛



Optimized design

Remaining imbalance is minimized to ensure maximum symmetry and the nut's center is highly accurate due to double guide.

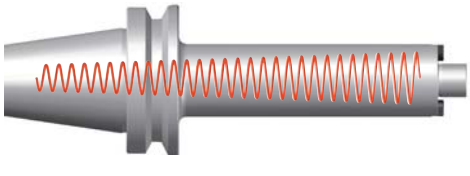
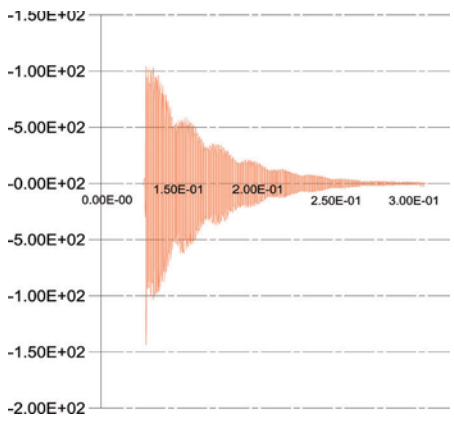
Comparison of Vibration damping time

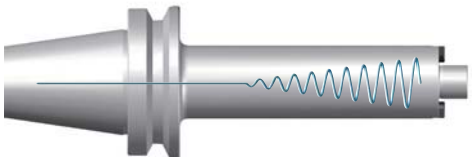
Standard Arbor

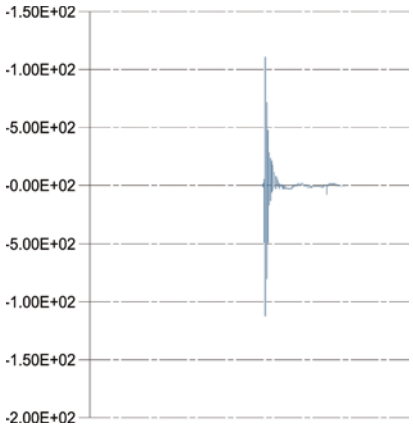




Longer Vibration damping time /
Chattering is caused while Overhang work

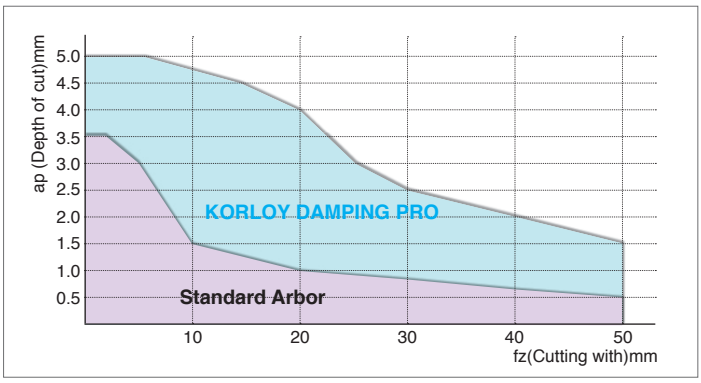
KORLOY DAMPIG PRO



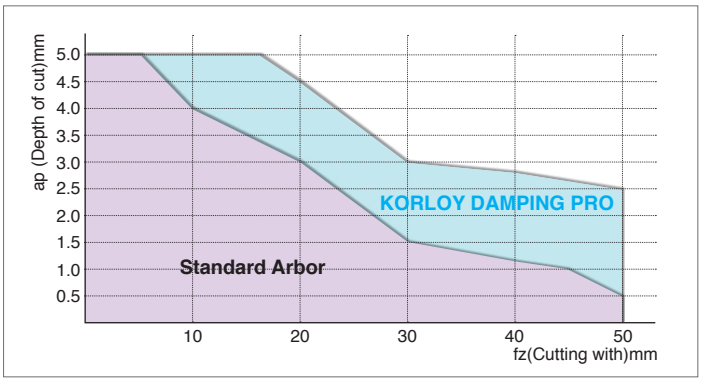


Short Vibration damping time /
Performance is 2~3 times better than standard arbor

Features



Cutting condition : fz(mm/t) = 0.1
vc(m/min) = 100
CUTTER : AMC4063HS 6flute
Arbor : BT50-FMC22-210 General arbor
KDP-BT50-FMC22-210



Cutting condition : fz(mm/t) = 0.1
vc(m/min) = 100
CUTTER : FMRC3063HRD-H 6flute
Arbor : BT50-FMC22-210 General arbor
KDP-BT50-FMC22-210

Application Example

Mold machining	Side milling cutter machining	Facing for long depth	Deep-hole Boring machining
			Better productivity than general arbor	Excellent performance in the deep grooving	Better productivity and surface roughness than General arbor	Better surface roughness and machinability than General arbor

Side milling cutter machining example

- Faulty occurrence on size and surface roughness by the vibration, when use the general arbor
- **Using DAMPING PRO, good size and surface roughness**

■ **General arbor**

Cutting condition :
vc(m/min) = 50
fz(mm/t) = 0.1
ae(mm) = 20

■ **DAMPING PRO**

Cutting condition :
vc(m/min) = 100
fz(mm/t) = 0.1
ae(mm) = 20

Big size Crankshaft machining example

- General arbor : ap=2mm
- KORLOY DAMPING PRO : ap=4mm available
- **2 times better productivity**

■ **General arbor**

Cutting condition :
vc(m/min) = 100
fz(mm/t) = 0.15
ap(mm) = 2

■ **DAMPING PRO**

Cutting condition :
vc(m/min) = 100
fz(mm/t) = 0.15
ap(mm) = 4

Technical information for Stainless steel

Guide of stainless-steel machining

- Stainless steels well known for their excellent anti-corrosive property.
- Excellent anti-corrosive property is due to the Chromium added to these alloys. In general, stainless have 4%~10% Chromium content.

● Classifications & Features of Stainless steel.

1) Austenite series : One of the most general kinds of stainless steels, it has some of the best corrosion-resistance properties due to a high Chromium & Nickel content. A high Nickel content also makes machining more difficult. Austenite series stainless steels are usually used for can processing, chemical products and construction purposes. (AISI 303,304,316)

2) Ferrite series : It has Chromium content similar to Austenite series, but none of the Nickel content which results in freer machining. (AISI 410,430,434)

3) Martensite series : The only stainless steel with the ability to be heat treated. It has a high carbon content but poor corrosion resistance, so it is used for parts that need higher hardness. (AISI410, 420,432)

4) Precipitate hardened series : A Chromium-Nickel alloy, it has improved hardness through low temperature heat-treatment and has superior corrosion resistance and toughness at the same time. (AISI 17, 15)

5) Austenite-Ferrite series : Though it has similar properties with Austenite and Ferrite, it has much more superior heat-resistance (approx. 2 times better). Usually used where thermal-corrosion stability is needed, such as condensers (AISI S2304, 2507).

● Difficult-to-Cut Factors of Stainless steel.

1) Work-hardening property - Causes premature wear of tool and poor control chip.

2) Low thermal conductivity - Causes plastic deformation of cutting edge and fast wear of tools.

3) Built-up-edge - More susceptible to micro-chipping on cutting edges and causes bad surface-finish.

4) Chemical affinity between tool and workpiece caused by work-hardening and low thermal-conductivity of workpiece, this might generate abnormal-wear, chipping and/or abnormal fracture.

● Tips for Machining of Stainless steel.

1) Use a tool that has higher thermal-conductivity
Low thermal-conductivity of stainless steels accelerates tool wear resulting from a decline in hardness of the cutting edge of an insert, this is due to heat piling up. It is better to use a tool that has higher thermal conductivity and with enough coolant.

2) Sharper cutting edge-line
It is necessary to utilize larger rake-angles and wider chip-breaker lands to reduce cutting-load pressure and prevent build-up-edge. This will help provide better chip control.

3) Optimal cutting condition
Inappropriate machining conditions like extremely low or high-speeds or low feed rates can cause poor tool life due to work-hardening of work piece.

4) Choose an appropriate tool
Tools for stainless steels should have good toughness attributes, enough strength on their edge-line (cutting edge) & a higher film adhesion.

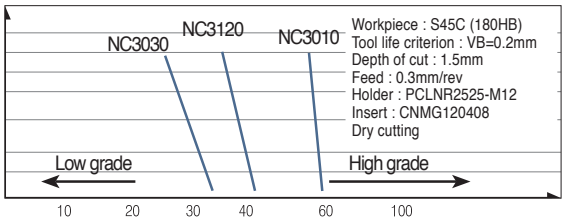
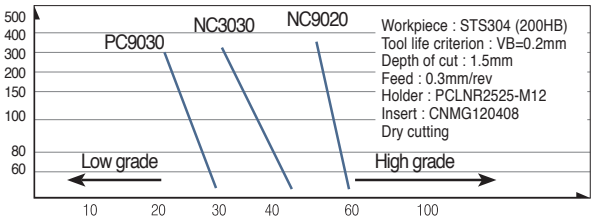
The affects of cutting condition

▶ The most desirable machining means short machining time, long tool life and good precision. This is the reason that proper cutting condition for each tools should be selected according to material's properties, hardness, shapes, the efficiency of machine.

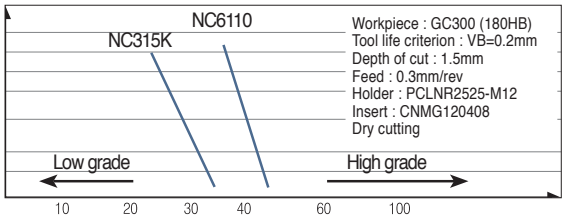
Cutting speed



The tool life feature of P grade



The tool life feature of M grade



The tool life feature of K grade

Cutting Speed's effects

▶ When the cutting speed increases up to 20% in an application, the tool life respectively decreases down 50%. Although inversely, if the cutting speed increases up to 50% the tool life decreases 20%. On the other hand if cutting speed is too low (20-40m/min) Tool life shortens due to vibration.

Feed

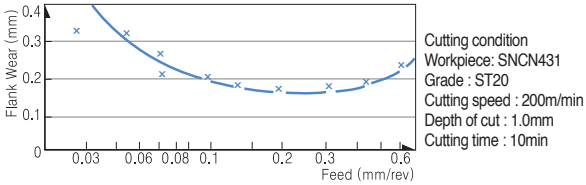
▶ The feed rate in turning means the progressed interval of a distance in a work piece within 1 revolution. The feed rate in a milling application means the table feed divided by number of teeth of cutter (feed rate per tooth).

The effects of feed

▶ When the feed rate decreases the flank wear is increased. When the feed rate is too low, the tool life shortens radically.

▶ When the feed rate increases, the flank wear increases due to high temperatures, however the feed rates effects tool life less than the cutting speed. And higher feed rates improve machining efficiency.

Relationship between feed and flank wear in steel turning



Depth of cut

▶ Determined by the required allowances in machining a material and the capacity the machine can tolerate. There are cutting limits according to the different shapes and sizes of the insert.

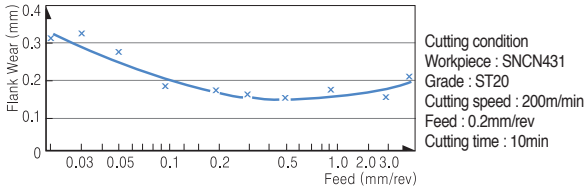
The effect of a depth of cut

▶ The depth of cut does not have a big influence on tool life.

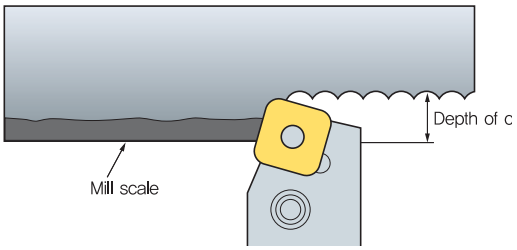
▶ When the depth of cut is small the work piece is not cut but rather rubbed. In these cases, machine off the work hardened parts that decrease tool life.

▶ When machining a cast skin or milling scale smaller depth of cuts usually cause chipping and abnormal wear because of hard impurities in the surface of the work piece.

Relationship between depth of cut and flank wear in steel turning



Surface parts including mill scale Roughing



Relief angle

▶ Relief angle avoids the friction between workpiece and relief face and makes cutting edge move along workpiece easily.

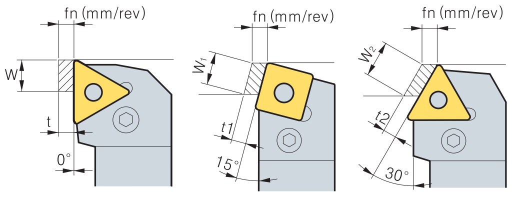
Side cutting edge angle

▶ Side cutting edge angle has big influence on chip flow and cutting force therefore proper Side cutting edge angle is very important.

● Side cutting edge angle and Chip thickness

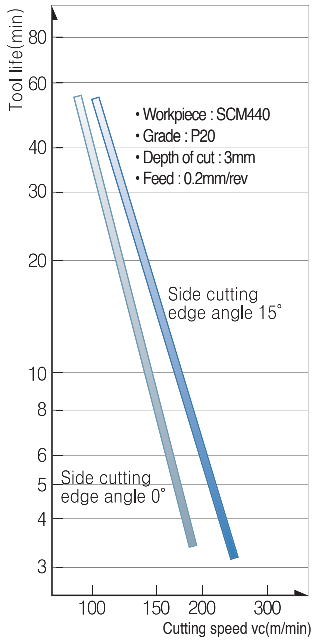


① Approach angle 0˚ ② Approach angle 15˚ ③ Approach angle 30˚

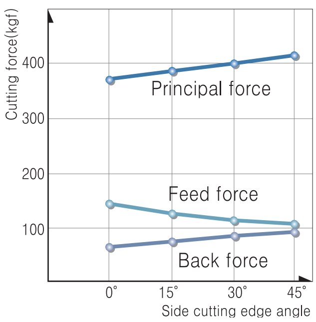
- As side cutting edge angle is getting bigger chips are getting thinner and wider(refer to left picture).
- At the same feed and depth of cut with approach angle 0˚ Chip thickness is the same as feed(t=fn) and chip width is equal to depth of cut (W=ap).

t1 = 0.97t, W1 = 1.04W
t2 = 0.87t, W2 = 1.15W

● Side cutting edge angle and Tool life



● Side cutting edge angle and 3 cutting forces

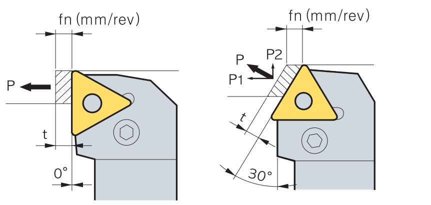


- Workpiece : SCM440(HB250)
- Grade : TNGA220412
- vc= 100m/min
- ap= 4mm
- fn= 0.45mm/rev

- Affects
  1. Big side cutting edge angle with the same feed makes chip attaching length longer and chip thickness thinner. So that cutting forces scatter to long cutting edge therefore tool life gets longer.
  2. Big side cutting edge angle for machining long bars can cause bending.

- Selection system
  1. Deep depth of cut finishing / Long thin workpiece / Low machine rigidity - Side cutting edge angle
  2. Hard and high calorific power workpiece / Roughing big workpiece / High machine rigidity - Side cutting edge angle

● Side cutting edge angle and Cutting load



① "Force P is loaded." ② "Force P is scattered to P1, P2."

As approach angle gets bigger Back force gets bigger and feed force gets smaller.

● Side cutting edge angle and Cutting performance

End cutting edge angle

It affects machined surface to prevent interference between surface of workpiece and insert.

Affects

1. If end cutting edge angle reduces cutting edge get stronger but cutting heat generated by machining increases.
2. Small end cutting edge angle can cause chattering due to the increases cutting force.

Nose-R

1. Nose-R affects not only surface roughness but strength of cutting edge.
2. In general, It's desirable that Nose-R is 2~3 times bigger than feed.

● Nose R and surface finish

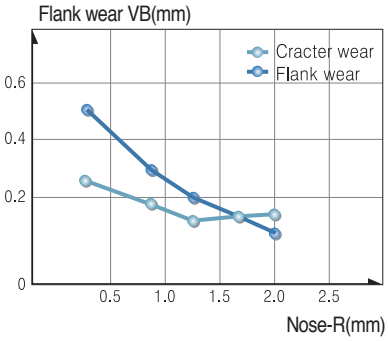
- fn = 0.3mm/rev

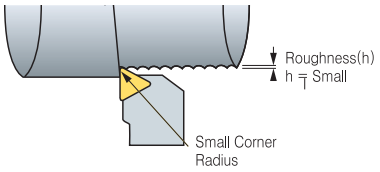
● Nose R and wear of tool



- Workpiece : SNCM439, HB200
- Grade : P10
- vc = 140m/min, ap = 2mm
- fn = 0.2mm/rev, T = 10min

Affects of Nose-R

1. Big Nose-R improves surface finish.
2. Big Nose-R improves cutting edge strength.
3. Big Nose-R reduces flank wear and crater wear.
4. Too big Nose-R causes chattering due to increased cutting force.



Selection system

1. For finishing with small depth of cut / long and thin workpiece / When machine power is low - Small Nose-R
2. For applications that need strong cutting edge such as intermittent and machining mill scale / For roughing of big workpiece / When the machine power is strong eough - Big Nose-R

The differences between general endmills and high speed endmills

General endmills		High speed endmills	
Cross section shape	Features	Cross section shape	Features
	- Applied for Low speed, High depth of cut, Low feed - Low hardness workpiece(general steel, cast iron)		- Applied for high speed, low depth of cut, high feed - Useful for hardened workpiece such as die steel

Calculations of cutting condition

● Calculations of Cutting speed

$$vc = \frac{\pi \times D \times n}{1000} \qquad n = \frac{1000 \times vc}{\pi \times D}$$

● Calculations of feed speed

$vf = n \times fn$ or $n \times fz \times z$

$$fn = \frac{vf}{n} \qquad fz = \frac{fn}{z} \text{ or } \frac{vf}{n \times z}$$

vc : Cutting speed(m/min) vf : Feed speed(m/min)
π : Circular constant (3.141592) fn : Feed per revolution(mm/rev)
D : Endmill diameter(mm) fz : Feed per flute (mm/t)
n : Revolution per minute(min^{-1}) z : Number of flute

Ball endmills cutting speed calculation formulas

Revolution per minute	$n = \frac{vc \times 1000}{D \times \pi}$
Cutting speed	$vc = \frac{D \times \pi \times n}{1000}$
Feed per tooth	$fz = \frac{vf}{z \times n}$
Feed per revolution	$fn = fz \times z$
Feed speed	$vf = fz \times z \times n$
Chip removal rate	$Q = ae \times ap \times vf$
Effective diameter of Ball Endmill	$D_{eff} = 2 \times \sqrt{D \times ap - ap^2}$ Calculation Table
	$D_{eff} = D \times \sin\left[\beta \pm \arccos\left(\frac{D-2ap}{D}\right)\right]$

The affection of flute length

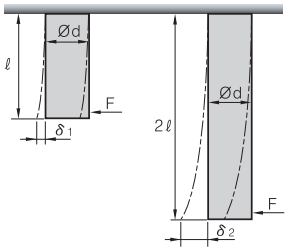
● Expression of aspect ratio

- Aspect ratio
- ℓ/d
- Ex) 3D, 15D, 22D

● Deformation rate according to length

- Deformation rate is reaction force against external force.
- Proportional to the cube of length
- Set flute length and overall length as short as possible
- The more flute the better rigidity
- When flute width rate is narrower drill's rigidity is higher.

$$\delta = \frac{P\ell^3}{3EI}$$



δ = Deformation volume **ℓ** = Length of cut

P = Cutting force **E** = Elasticity coefficient

I = Inertia moment ($I = \frac{\pi d^4}{64}$)

- ℓ → 2ℓ
- δ1 → δ1 = 8δ1 = δ2

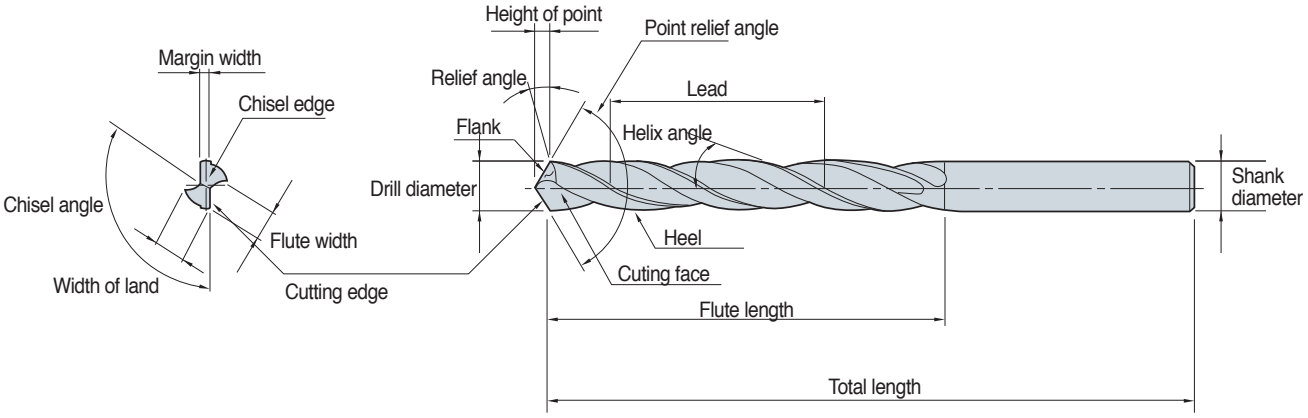
The shape of drills and the names



Shape and the feature of cutting

Helix angle	Plays rake angle of cutting edge's role. If helix angle increases Cutting force decreases. On the other hand If helix angle is too big Drill rigidity decreases. Poor machinability ◀ low - Helix angle - high ▶ Smooth chip evacuation Hard workpiece(hardened steel) ◀ low - Helix angle - high ▶ Soft material(aluminum etc)
Length of flute	The path of both chip evacuation and cooling lubricant. Too big length of flute weakens drill rigidity and too small length of flute worsens chip evacuation to breakage.
Point angle	Point angle has big influence on cutting performance. It mainly depends on workpiece. In case of standard drills Point angle is generally 118. thrust resistance decrease ◀ low - Point angle - high ▶ thrust resistance increase Torque increase, Burr on exit increase ◀ low - Point angle - high ▶ Torque decrease, Burr on exit decrease Soft material(aluminum etc) ◀ low - Point angle - high ▶ Hard workpiece(hardened steel)
Margin	While machining Margin is the part of contact between workpiece and drill's external. It prevents bending and plays guide's role . It depends on drill size. Cutting force decrease ◀ small - Margin - big ▶ Cutting force increase Poor guide ◀ small - Margin - big ▶ Good guide
Web thickness	Web is the part of center of drill and drill's rigidity depends on the web. Drill needs cutting edge, chisel edge, at the tip of drill because drill makes a hole at the beginning of drilling . When web thickness is big Thinning is needed to reduce cutting force. Cutting force decrease ◀ small - Web thickness - big ▶ Cutting force increase Rigidity decrease ◀ small - Web thickness - big ▶ Rigidity increase Good chip evacuation ◀ small - Web thickness - big ▶ Bad chip evacuation Soft material(aluminum etc) ◀ small - Web thickness - big ▶ Hard workpiece(hardened steel)
Back taper	Drill diameter size is getting smaller from point to shank in order to avoid the friction between drill periphery and workpiece. The decrease of diameter divided by flute length 100mm generally becomes 0.04~0.1mm. As for high performance drills and drills for hole shrinkage workpiece during operation have big back taper.
Thinning	In general drills Thrust effects on chisel over 50%. Chisel edge length depends on web thickness and chisel angle. But if web is thin Drill rigidity weaken. Therefore without web thickness change Thinning makes chisel edge short or gives rake angle. In other words, Thinning makes rake angle at chisel and improves chip evacuation and decrease thrust.

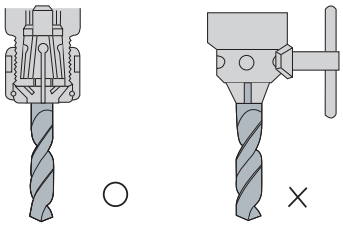
Cautions

● Selection of drill chuck

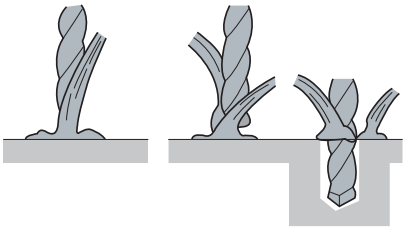
• Collect chuck is favorable Because it has strong grip power
(General drill-chuck and Keyless chuck don't have enough grip power.)



• Collect chuck • General drill-chuck

● Coolant supply

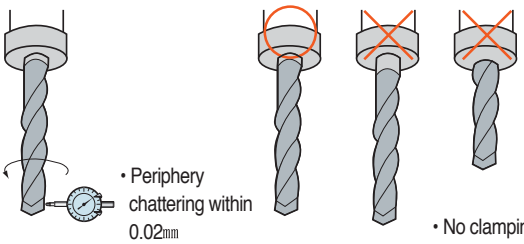
• Supply enough coolant around hole entrance.
• Standard cutting oil pressure : 3~5kg/㎠, Flux : 2~5l/min.



• Supply much coolant at hole entrance

● Mounting drill

• When mounting drill Periphery chattering should be within 0.02㎜.
• Flute should not be clamped.

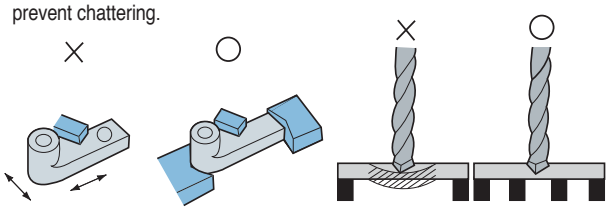


• Periphery chattering within 0.02㎜

• No clamping flute

● How to clamp workpiece

• At high performance drilling High thrust, torque and horizontal cutting force work at the same time so that workpiece should be clamped strongly to prevent chattering.



• Uniformed and strong clamping is needed (Right and left, up and down)

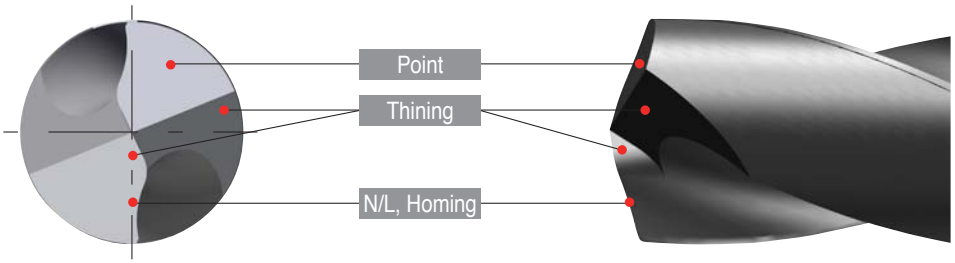
• Strong clamping is needed because bending causes chipping

Notice

1) For better drill's life, small damage and wear are favorable to be regrinding.
2) Damage and wear size should be within 1.5㎜ for regrinding.
3) If drill has crack, regrinding is impossible.
4) Ordering for regrinding is acceptable or purchase regrinding machine

Regrinding procedures

● Regrinding mathod (Mach Drill)

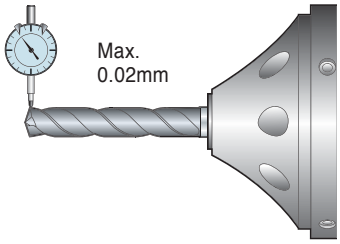


1) Preparation

- Determination of regrinding areas Check the cutting edge for damage and wear If large fracture is found, remove it by rough grinding.

2) Grinding operation

- Drills setting
Drill is clamped to collet chuck Chattering is kept within 0.02mm.

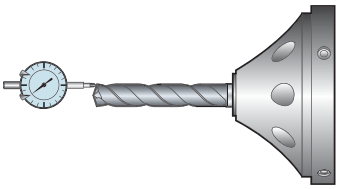


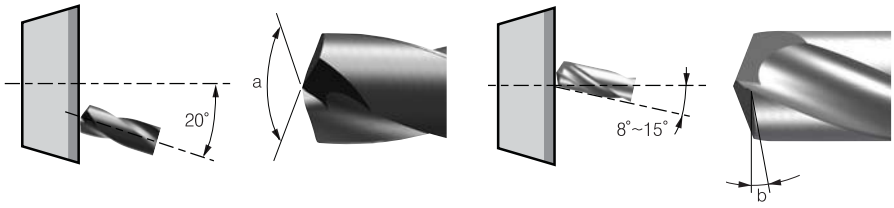
3) Grinding operation-Grinding point

- Check damage and wear at the point and remove it completely.
- The difference of the lip height is kept within 0.02mm.

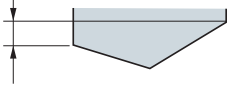
Point angle(a) : 140°

Point relief angle(b)t : 8°~ 15°





The difference of the lip height Max. 0.02mm

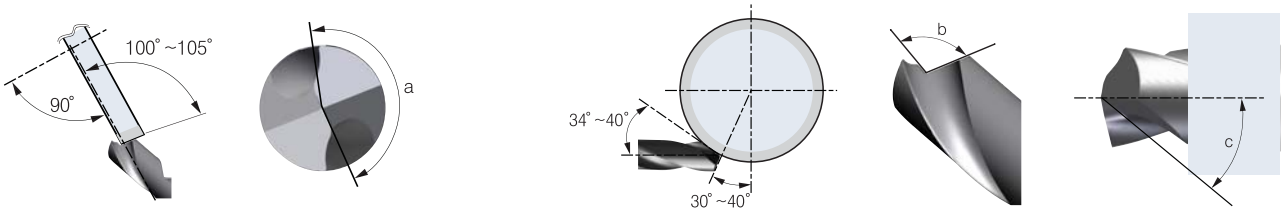


4) Grinding operation-Thinning grinding

- Considering N/L width Cutting edge length from the center of drill axis should be 0.03~0.08mm for balancing.
- Set the wheel to tilt drill axis by 34°~ 40°.

Thinning angle(a)° : 155°~ 160°/ Thining open angle(b) : 100°~ 105°

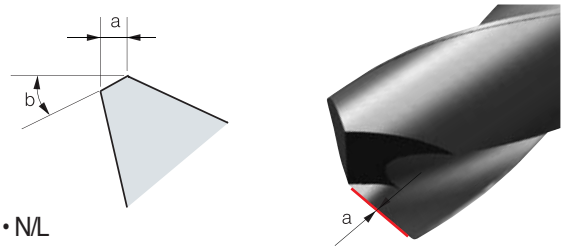
Thinning relief angle(c) : 34°~ 40°



5) Grinding - N/L grinding and honing

- Using diamond chisel Grinds the width flat along point cutting edge.
- After negaland operation Finishes with brush or handstone.

N/L width(a) : 0.05mm~0.16mm / N/L angle(b) : 24°~26°



● TIP

· Making point

- Without center drill, the point width should be below 0.10mm.

· Recommended grinding condition

- Diamond wheel : 240~400 mesh
- Diamond chisel : 400~600 mesh
- Diamond hand stone : 800~1500 mesh
